<i>Introduction</i>	10

Chapter I

Children in war

Wars and civil conflicts are taking a massive toll on children. The numbers, though imprecise, are devastating: approximately 2 million children have been killed during the last decade, and between 4 million and 5 million disabled. Twelve million more have been uprooted from their homes, and countless others face the heightened risk of disease and malnutrition and of separation from their families.

12

International law provides standards for protecting children in war. These standards must be vigorously enforced to create a zone of peace for the young. UNICEF, founded to provide emergency relief for children in the aftermath of World War II, takes this opportunity in its 50th anniversary year to set out an Anti-war Agenda, a series of vital, practical actions to help stall the momentum of violence. The Agenda calls for an end to the recruitment and conscription into the military of children under the age of 18, for a ban on the manufacture, use, stockpiling and sale of all anti-personnel land-mines and for strengthening of procedures to monitor and prosecute war crimes. The Agenda also urges support for long-term development, reconciliation, rehabilitation and education for peace.

Chapter II

Fifty years for children

This chapter traces UNICEF's and the world's response to the needs of children, starting with the 1950s, when mass campaigns promised to end a number of infectious diseases, including tuberculosis, yaws, trachoma, leprosy and malaria. The 1960s' focus on eradicating poverty grew during the 1970s into the development of flexible, community-oriented initiatives. Then in the 1980s, with economies in decline, UNICEF launched the 'child survival and development revolution', which, through simple, cost-effective methods, saved more than 12 million children's lives by the end of the decade.

42

With the 1990s, a new era has opened for children, with the world making great strides towards achieving the World Summit for Children's basic health, nutrition and education goals for the year 2000 and a campaign that has brought universal ratification of the Convention on the Rights of the Child nearly within reach. Looking towards the year 2000 and beyond, children are increasingly at the centre of the international human rights and development agenda, and despite the depredations of war and poverty, global progress is possible.

The material in this chapter draws on the historical research of Maggie Black on UNICEF, including her books *Children First: The story of UNICEF past and present* (UNICEF/Oxford University Press, to be published in 1996) and *The Children and the Nations* (UNICEF, 1986).

Chapter III

Statistical tables

Statistics provide an essential foundation for gauging children's well-being and are vital indicators of the care, nurture and resources that children receive in their communities and countries. We are reminded that more than 12 million children each year continue to die from the 'silent' emergencies of preventable diseases and malnutrition. Statistics such as those on infant and child mortality, immunization, maternal mortality, malnutrition and school enrolment chart the progress countries are making towards the goals set at the World Summit for Children and in overcoming disparities, such as the discrimination against girls and women. Basic indicators on nutrition, health, education, population, economic progress and the situation of women are given. Regional summaries are also provided.

“The most important meaning of this Nobel award is the solemn recognition that the welfare of today’s children is inseparably linked with the peace of tomorrow’s world.”

Henry R. Labouisse, Executive Director of UNICEF (1965-1979),
in his acceptance of the Nobel Peace Prize in 1965 for UNICEF.

Foreword

It was the suffering of children in war that prompted the founding of UNICEF 50 years ago. It is the continuing suffering of children that reminds us how much more we need to do, and how enormous is the task still before UNICEF. *The State of the World's Children* report this year examines what it calls “the terrible symmetry” framed by these 50 years.

Please join me in supporting the urgent effort to bring peace to children—peace in every sense of the word; building an ethic against violence directed at children, against drafting children as combatants, against planting anti-personnel land-mines and against holding children as hostages. And, as affirmed by the Declaration of the 1990 World Summit for Children and enshrined in the 1989 Convention on the Rights of the Child, may nations abide by the principle of “first call for children” always—with their survival, protection and development given high priority—in times of adversity as well as in times of beneficence, in times of war as well as in times of peace.

UNICEF has worked and has encouraged others during this half-century to make this principle a reality. This report documents that great work. I recommend these pages to all readers. They reflect our common hopes and they summon us to even greater common action on behalf of the children of the world.

Boutros Boutros-Ghali
United Nations Secretary-General

Orphaned children in Baidoa, Somalia.

Preface

This special issue of *The State of the World's Children* marks the 50th anniversary year of UNICEF. As such, it aims to fulfil three purposes. First, it proposes an agenda against war as a vital step to prevent and alleviate the suffering of children in armed conflict. We start with children in war because their contemporary predicament is both overwhelming and inescapable.

Second, it reviews the efforts of UNICEF in its first half-century to cope with children submerged not only in conflict but also in the silent emergencies of poverty and preventable disease. And it shows how many governments and communities, with UNICEF support, have made great progress in improving the health, nutrition and education of their children.

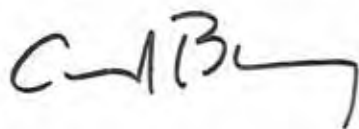

Third, it retains the annual presentation of carefully assembled statistical data, so that the progress towards the year 2000 goals, adopted at the 1990 World Summit for Children, can be readily assessed.

I believe these three chapters provide a good sense of where UNICEF has been, of its current priorities, and, to the extent possible, of where it is headed.

Ideas and knowledge have changed and expanded dramatically over the past 50 years. Accordingly, so has our ability to make children's lives better. The global community, almost unanimously, has committed itself to doing just that, as expressed in the words and ethos of the World Summit Declaration and the Convention on the Rights of the Child.

With renewed commitment, we shall work for the day when the Declaration and the Convention are transformed from articles of faith into expressions of reality for the lives and hopes of the world's children.

This is also my first *State of the World's Children* report as Executive Director, and I want to honour my remarkable predecessor, James P. Grant. With his indomitable and generous spirit, he moved us all towards a better world for children. I am sure the evidence of progress in many areas of children's lives would have pleased him, as would our pledge to promote the Anti-war Agenda set forth in this report.

Carol Bellamy
UNICEF Executive Director

The State of the World's Children 1996

I see the world gradually being turned into a wilderness, I hear the ever-approaching thunder, which will destroy us too, I can feel the suffering of millions, and yet, if I look up into the heavens, I think that it will all come right, that this cruelty, too, will end.

These are the words of a 15-year-old girl. They could have been written yesterday—by a child in Bosnia or Liberia, in Afghanistan or the Sudan. In fact, they were written more than 50 years ago in the Netherlands, by Anne Frank, who died shortly afterwards in a Nazi concentration camp.

In 1996, UNICEF marks its 50th anniversary. The organization was founded in 1946 in the aftermath of World War II, as the United Nations International Children's Emergency Fund. Times have changed—and they have not changed. In 1996, the world's children again face the carnage of war. Millions live with shattered innocence, daily terror and stifled hopes, which Anne Frank would recognize only too well.

This year, *The State of the World's Children* reflects the terrible symmetry of 1946 and today. Chapter I is a report on children in war—on their lives and on their deaths. Children thrown into mass graves. Children wandering without their parents or wasting away in

refugee camps. Children brutalized into being killers themselves.

Chapter II of the report then takes a historical perspective. It looks at what has changed in the last 50 years. The thread of violence runs through this too, for communities and children suffering the silent emergencies of poverty and hunger. But there have also been enormous achievements.

Child mortality rates have fallen by about 50 per cent, and total annual child deaths have dropped dramatically from 25 million to 12.5 million.¹ Since 1980, basic immunization has saved the lives of about 20 million children.² As the second part of the report points out, there has also been major progress in the priority accorded to children. Officially at least, governments respect and value children as never before. The Convention on the Rights of the Child entered into force in 1990 and had been ratified by 179 countries as of the end of September 1995.

If children are loved and valued, why are they still being used as

cannon-fodder? A weary response might lay the blame on innate human cruelty and duplicity. A cynic would also argue that incessant television coverage has done little more than stun our sensibilities, and that all conventions and declarations will inevitably crumble before the barrel of a gun.

UNICEF takes a different view. It believes that this gap between rhetoric and reality represents a historic challenge. In response to so much destruction and pain, there have also been unprecedented efforts at peacemaking and caring for the victims. The urgency now is to vastly enhance the means both to prevent future conflicts and to better support victims.

UNICEF argues that concern for children is one of those means. We believe that love and respect for children are key to humanitarian and political progress. Many of today's most intractable disputes, for all the ethnic or religious character they acquire, are at heart struggles for resources and for survival. Today's problems of poverty and violence will never subside unless we invest in the physical, mental and emotional development of the next generation.

Concern for children is also a

way of addressing today's violence. Wars are not going to disappear overnight, but we can at least mitigate their effects and ensure that they do not target children and women. To that end, this report sets out UNICEF's Anti-war Agenda—a series of steps that we believe to be both realistic and effective and that would dramatically improve the well-being of children in situations of conflict. Vital measures here include removing child soldiers from the battlefields, and banning the manufacture of weapons such as anti-personnel land-mines that target civilians. Better information can also play a part: we can publicly recognize and systematically document genocide and instances of torture and rape to warn potential perpetrators that the world is watching—that there will be no impunity.

Beyond defending children, we should also use child protection as a means of opening up dialogue. The idea of children as 'zones of peace' has already proved its worth with temporary cease-fires to allow children in war zones to be vaccinated, or to allow food supplies to pass through enemy lines.

At the same time, we need to address rehabilitation. Many children have immediate needs for food

or shelter. They also require psychosocial support—to help them recover from emotional wounds. Communities, too, require social rehabilitation. In many of today's chronic disputes violence does not cease, it merely subsides—sustained partly by the persistence of weapons and the pervasive military ethos. Avoiding future conflicts will require not just caring for the youngest victims of war, but also educating them for peace.

The Anti-war Agenda rests on the proposition that much of the tragedy befalling children is preventable. The evil deeds that this report documents are, after all, driven by human behaviour. Children are suffering as a direct and immediate consequence of the decisions of adults. If conflict seems, at times, to be inevitable, there is nothing inevitable about children bearing the brunt of its consequences. Brutality, violence, rape and torture—all would stop tomorrow if the will to stop them existed, or if the rest of us devised means to compel them to be stopped.

In so doing, the world would be living up to the fundamental purpose of the United Nations Charter: "...to save succeeding generations from the scourge of war."

Children in war

The establishment of the United Nations after World War II raised hopes of a new era of peace. This was over-optimistic. Between 1945 and 1992, there were 149 major wars, killing more than 23 million people. On an average yearly basis, the number of war deaths in this period was more than double the deaths in the 19th century, and seven times greater than in the 18th century.³

War and political upheaval have been tearing whole countries apart—from Bosnia and Herzegovina to Cambodia to Rwanda. And this vortex of violence is sucking in ever-larger numbers of children. Entire generations have grown up in the midst of brutal armed conflicts. At the end of 1995, conflicts have been running in Angola for over 30 years, in Afghanistan for 17 years, in Sri Lanka for 11 years and in Somalia for 7 years.

Children have, of course, always been caught up in warfare. They usually have little choice but to experience, at minimum, the same horrors as their parents—as casualties or even combatants. And children have always been particularly exposed. When food supplies have run short, it is children who have

been hardest hit, since their growing bodies need steady supplies of essential nutrients. When water supplies have been contaminated, it is children who have had the least resistance to the dangers of disease. And the trauma of exposure to violence and brutal death has emotionally affected generations of young people for the rest of their lives. Recent developments in warfare have significantly heightened the dangers for children. During the last decade, it is estimated (and these figures, while specific, are necessarily orders of magnitude) that child victims have included:

- ▶ 2 million killed;
- ▶ 4-5 million disabled;
- ▶ 12 million left homeless;
- ▶ more than 1 million orphaned or separated from their parents;
- ▶ some 10 million psychologically traumatized.⁴

The increasing number of child victims is primarily explained by the higher proportion of civilian deaths in recent conflicts. In the wars of the 18th, 19th and early 20th centuries, only about half the victims were civilians.

In the later decades of this century the proportion of civilian victims has been rising steadily: in World War II it was two thirds, and by the end of the 1980s it was almost 90 per cent.⁵

This is partly a function of technology. Aerial bombardment

Entire generations have grown up in the midst of brutal armed conflicts. At the end of 1995, conflicts have been running in Angola for over 30 years, in Afghanistan for 17 years, in Sri Lanka for 11 years and in Somalia for 7 years.

Photo: One of the rights of children is to be protected from military conscription, but children have participated in a number of recent conflicts. Young soldiers from Myanmar drill.

Recently, in 25 countries, thousands of children under the age of 16 have fought in wars. In 1988 alone, they numbered as many as 200,000.

has extended the potential battle zone to entire national territories. World War II saw a massive increase in indiscriminate killings, with the bombings of Coventry and Dresden, for example, and the atomic bombs that were dropped on Hiroshima and Nagasaki. And this pattern was repeated in the Viet Nam war, which is estimated to have cost 2.5 million lives.

A further cause of the rising death toll for civilians is that most contemporary conflicts are not between States, but within them. Rather than being set-piece battles between contending armies, these are much more complex affairs—struggles between the military and civilians, or between contending groups of armed civilians. They are as likely to be fought in villages and suburban streets as anywhere else. In this case, the enemy camp is all around, and distinctions between combatant and non-combatant melt away in the suspicions and confusions of daily strife. In 1994, the UN Department of Humanitarian Affairs reported that 13 countries had ongoing “complex emergencies” of this type, and it classified over 20 million people as “vulnerable”; it also listed 16 other countries with potential emergencies.⁶

Families and children are not just getting caught in the crossfire, they are also likely to be specific targets. This is because many contemporary struggles are between different ethnic groups in the same country or in former States. When ethnic loyalties prevail, a perilous logic clicks in. The escalation from ethnic superiority to ethnic cleansing to genocide, as we have seen, can become an irresistible process. Killing adults is then not enough; future generations of the enemy—their children—must also be eliminated. As one political commentator expressed it in a 1994 radio broadcast before violence erupted in Rwanda,

“To kill the big rats, you have to kill the little rats.”⁷

In these circumstances, classifying such processes as ‘complex emergencies’ is incomplete. To say they are complex is true enough, but this would cover most forms of human activity. It also obscures the fact that these are fundamentally political disputes. Even to say that they are ‘emergencies’ is optimistic, suggesting that they will soon be over. Rather, these are chronic forms of social conflict whose violent repercussions in the form of ‘total war’ could be felt for years or decades ahead.

Children as soldiers

Most child casualties are civilians. But one of the most deplorable developments in recent years has been the increasing use of young children as soldiers. In one sense, this is not really new. For centuries children have been involved in military campaigns—as child ratings on warships, or as drummer boys on the battlefields of Europe. Indeed the word ‘infantry’, for foot-soldiers, can also mean a group of young people. What is frightening nowadays is the escalation in the use of children as fighters. Recently, in 25 countries, thousands of children under the age of 16 have fought in wars.⁸ In 1988 alone, they numbered as many as 200,000.

One reason for this is the proliferation of light weapons. In the past, children were not particularly effective as front-line fighters since most of the lethal hardware was too heavy and cumbersome for them to manipulate. A child might have been able to wield a sword or a machete but was no match for a similarly armed adult.

However, a child with an assault rifle, a Soviet-made AK-47 or an American M-16, is a fearsome match for anyone. These weapons

I dream of peace: The words of children in former Yugoslavia

We are only twelve years old. We can't influence politics and the war, but we want to live! And we want to stop this madness. Like Anne Frank fifty years ago, we wait for peace. She didn't live to see it. Will we?
—Students from a fifth-grade class

From the group, they chose the ones they were going to kill. They picked my uncle and a neighbour! Then they machine-gunned them to death. After that, the soldiers put the women in the front cars of the train and the men in the back. As the train started moving, they disconnected the back cars and took the men off to the camps. I saw it all!

Now I can't sleep. I try to forget, but it doesn't work. I have such difficulty feeling anything any more. —*Alik, 13*

"When I close my eyes, I dream of peace."

Aleksandar, 14, said this just after enduring a dressing change of the terrible burn wounds he suffered from a Molotov cocktail explosion. His words became the title of the book, *I dream of peace* (UNICEF/HarperCollins, 1994), the thoughts and paintings of children recorded by UNICEF in the course of its programme to help children in former Yugoslavia deal with war-related psychological trauma.

Illustration: "Wounded children in hospital", a drawing from I dream of peace, by 14-year-old Suzana

A grenade had landed on our shelter. We had to climb over the dead bodies to get out. Meanwhile the snipers kept shooting at us.

My father was one of those wounded and was taken away to the hospital. We've not seen him since, but I hope that he is still alive, perhaps in one of the detention camps.

I try not to talk about these things, but I get so upset and keep having nightmares about what happened. —*Kazimir, 13*

I had a new tricycle, red and yellow and with a bell...Do you think they have destroyed my tricycle too? —*Nedim, 5*

I remember going to our apartment during an alert. When I entered the corridor, all the doors were closed. Slowly, I walked through the dark and opened the bedroom door. All at once, the sun shone brightly upon me. My sadness and fear completely vanished. But while I was enjoying it, I felt as if I had no right to such happiness. —*Ivan, 13*

So many people have been killed fighting for justice. But what justice? Do they know what they are fighting for, who they are fighting?

The weather is growing very cold now. No longer can you hear the singing of the birds, only the sound of the children crying for a lost mother or father, a brother or a sister.

We are children without a country and without hope. —*Dunja, 14*

No film can adequately depict the suffering, the fear and the terror that my people are experiencing. Sarajevo is awash in blood, and graves are appearing everywhere. I beg you in the name of the Bosnian children never to allow this to happen to you or to people anywhere else. —*Edina, 12*

Our teacher has told us about Anne Frank, and we have read her diary. After fifty years, history is repeating itself right here with this war, with the hate and the killing, and with having to hide to save your life.

A teenage soldier's story

UNICEF/IS-4125/P.2002

Like many of his friends, Sergeant Lawrence Moore got ensnared in Liberia's civil war without stopping to think much about why. With children all over the country enlisting in militias, when he was 15 it just seemed the thing to do.

With the war over, Sgt. Moore, who gives his age as 20, entered Monrovia, the capital, for the first time. He rode in from the bush with his leader....

Strangely, though, for Sgt. Moore, like so many teenage fighters, their triumphal return to the capital has turned into a story of loss. Gone are the carefree years of adolescence. Gone, too, is the sense of purpose, even amid the horror, of the warrior's life. But most of all, gone is any sense of hope about the future.

Unschooling and inarticulate, [the] young fighters rarely seem clear about why they joined the militia in the first place. One young fighter told of how [his militia] had killed his family... "But I joined them because they are the best."

Sgt. Moore, too, joined. "The first time I was sent to the front, I was so happy,

because I found so many of my friends there...."

Like those earlier fighters, Sgt. Moore readily admits his impressionability. Wounded in the hand and foot in his very first combat, he told of how awed he had been to be taken to a field hospital for a week's treatment, a sign that for once he truly belonged to something....

Sgt. Moore, who was quickly sent back to the front, says, "We were losing a lot of men, but we killed a lot of them too, plenty. One night, one of my friends died right in front of me," he added. "I felt very bad, but I never stopped fighting. I said to myself, this is war."

As with so many other questions, when asked how many people he had personally killed, the young man with the gentle face said he didn't really know. "I killed so many on the battlefield, but never any civilians," he insisted. "When I killed my enemies, it felt good. But right now, I pray God to forgive me...."

Suddenly idle in Monrovia, with no clothes or money, another young fighter

spoke with bitterness about how his leader's teenage son was already flying around town aboard a shiny motorcycle, while top officials already seemed locked in a best-dressed contest that mirrored their frenetic jockeying for power.

"When I think of the five years I spent in the bush, killing people and being shot at, I feel pretty stupid," the soldier said. "We were giving our lives for people who by tomorrow won't remember how they got where they are...."

That evening, the boy soldier, who was apparently being tailed by informers, was arrested. A payment secured his release and [a] reporter gave him some cash to flee the city. Asked what he would try to do, he answered with the only thing life so far has taught him. "My mother is in the United States," he said. "I will try to get to the United States and become a US marine." —by Howard W. French

Photo: A gun-carrying boy soldier is watched by other children in the Liberian town of Bong Mines.

are very simple to use. The AK-47 can be stripped and reassembled by a child of 10. The rifles have also become much cheaper and more widely available—having few moving parts they are extremely durable and have steadily accumulated in war zones.

Since their introduction in 1947, around 55 million AK-47s have been sold; in one African country, for example, they cost no more than US\$6 each.⁹ The M-16 is just as ubiquitous, and has been described by one military historian as the “transistor radio of modern warfare.”¹⁰

Besides being able to use lethal weapons, children have other advantages as soldiers. They are easier to intimidate and they do as they are told. They are also less likely than adults to run away and they do not demand salaries.

In long-drawn-out conflicts children also become a valued resource. Many current disputes have lasted a generation or more—half of those under way in 1993 had been going on for more than a decade. Children who have grown up surrounded by violence see this as a permanent way of life. Alone, orphaned, frightened, bored and frustrated, they will often finally choose to fight. In the Philippines, which has suffered for decades from a war of insurgency, many children have become soldiers as soon as they enter their teens. When schools are closed and families fragmented, there are few influences that can compete with a warrior's life.¹¹

Indeed, in these circumstances, a military unit can be something of a refuge—serving as a kind of surrogate family. In Uganda in 1986, the National Resistance Army had an estimated 3,000 children, many under 16, including 500 girls, most of whom had been orphaned and who looked on the Army as a replacement for their parents.¹²

At a more basic level, joining an army may also be the only way to survive. Many children joined armed groups in Cambodia in the 1980s as the best way to secure food and protection. Similarly, in Liberia in 1990, children as young as seven were seen in combat because, according to the Director of the Liberian Red Cross, “those with guns could survive.” In Myanmar, parents volunteer their children for the rebel Karen army because the guerrillas provide clothes and two square meals a day; in 1990, an estimated 900 of the 5,000-strong Karen Army were under the age of 15.¹³

Finally, children may also have active reasons to want to fight. Like adults, they too may see themselves fighting for social justice—as was often the case in Central America or South Africa—or they may want to fight for their religious beliefs or cultural identity. In more personal terms, they may also be seeking revenge for the deaths of their parents, brothers or sisters.

Many children, therefore, want to become soldiers and offer themselves for service. Others are deliberately recruited. This was true in Liberia, where a quarter of the combatants in the various fighting factions were children—some 20,000 in all. Indeed, the National Patriotic Front of Liberia had its own ‘small boys unit’, ranging in age from 6 to 20 (Panel 2).

Armed groups will often aim their propaganda specifically at young people. In Sri Lanka, the Liberation Tigers of Tamil Eelam (LTTE) have been particularly active in the school system, indoctrinating children.

In these circumstances, children can be expected to join up. But even if they do not volunteer they may be recruited forcibly. Over the past decade, government forces in El Salvador, Ethiopia, Guatemala and

Children who have grown up surrounded by violence see this as a permanent way of life. Alone, orphaned, frightened, bored and frustrated, they will often finally choose to fight.

UNICEF/STEFANO RICCI

The fighting in Bosnia and Herzegovina has not spared the children. In Sarajevo, almost one child in four has been wounded.

Myanmar, among others, have all conscripted children. In the 1980s, the Ethiopian army would kidnap boys of 15 or younger from the villages and the poorest quarters of the cities, as well as from schools.¹⁴ Opposition movements in many countries have also seized children—as in Angola, Mozambique, Sri Lanka and the Sudan.

The Renamo forces in Mozambique, in particular, systematically practised forced recruitment. Renamo had at least 10,000 boy soldiers, some as young as six years old. Similarly, in Angola, a 1995 survey found that 36 per cent of children had accompanied or supported soldiers, and 7 per cent of Angolan children had fired at somebody.¹⁵

Once recruited, children undergo varying degrees of indoctrination, often verging on the brutal. While in the early 1980s rebel groups in El Salvador offered primary school instruction, usually the training offered is less benevolent. Indigenous children in Peru, who have been forced to join guerrilla bands, have undergone long periods of forced political indoctrination. And others have suffered particularly brutal forms of induction. Some rebel groups in Cambodia and Mozambique turned children into fierce warriors by subjecting them to a brief period of terror and physical abuse—'socializing' them into violence. Much the same thing has been happening more recently in Sierra Leone, where in 1995 the Revolutionary United Front has been raiding villages to capture children into its ranks and force them to witness or take part in the torture and execution of their own relatives. Thus outlawed and brutalized, and often fed crack or other drugs, the children have been led to neighbouring villages to repeat the exercise.¹⁶

Children's actual duties in war-

fare cover the whole range of military activities. At relatively quiet times in camp this may be little more than cooking or carrying water. Being small and inconspicuous, children also have particular value as messengers or as spies. In Uganda in 1986, the National Resistance Army sent children into the capital to spot the government fortifications and when the shelling started, the children mingled with the fleeing crowds and threw hand-grenades at trucks full of government soldiers.¹⁷

And while children might be thought to be the people deserving greatest protection, as soldiers they are often considered the most expendable. During the Iran-Iraq war, child soldiers, for example, were sent out ahead in waves over minefields.¹⁸

Torture and rape

Many children suffer appalling violence as soldiers, but even those who remain 'civilians' can be subjected to horrific experiences. Anything that can be done to adults, however monstrous, can also be visited on children. Children have been tortured as part of collective punishments for whole communities, or as a means of extracting information about peers or parents. They have also been tortured as a way of punishing their parents, or in some cases simply for entertainment. Once immersed in this savage environment, differences of age soon seem irrelevant.

This also means that children are as likely as adults to be captured and imprisoned. The treatment of child prisoners is a matter of increasing concern—particularly in Rwanda where, for the first time in history, children have been imprisoned and are facing trial for genocide.

In these violent circumstances,

women and girls in particular suffer the added trauma of sexual abuse and rape, which psychologists identify as the most intrusive of traumatic events. Without help, girls will carry the long-term effects of such abuse into their adult lives.

Sexual violence is particularly common in ethnic conflicts. In fighting in Bosnia and Herzegovina and Croatia, it has been deliberate policy to rape teenage girls and force them to bear 'the enemy's' child. A European Community fact-finding team estimated that more than 20,000 Muslim women have been raped in Bosnia since fighting broke out in April 1992.¹⁹

In Rwanda, rape has been systematically used as a weapon of ethnic cleansing to destroy community ties. In some raids, virtually every adolescent girl who survived an attack by the militia was subsequently raped. Many of those who became pregnant were then ostracized by their families and community; some abandoned their babies, others committed suicide. In the Renamo camps in Mozambique, young boys, who themselves had been traumatized by violence, frequently inflicted sexual violence on young girls—threatening to kill or starve them if they resisted.²⁰

Even women and girls who are not physically forced to have sex may still be obliged to trade sexual favours for food, shelter or physical protection for themselves or their children.

The rise of sexually transmitted diseases, and particularly of HIV/AIDS, is therefore inevitable. One factor contributing to the high rate of AIDS in Uganda could be that some women had to trade sex for security during the country's civil war. As a result, the next generation is at an even greater disadvantage, as more children are born with AIDS or are orphaned.

Uprooted children

The waves of violence that have swept across the world in recent years have uprooted enormous numbers of people—at least half of whom are children. Some are classified as 'displaced', having fled their homes to move elsewhere within their own country; others are 'refugees' who have crossed borders into neighbouring countries. The total number of uprooted people is currently around 53 million—one out of every 115 people on earth has been forced into flight.²¹ Since three quarters of refugees have fled from one developing country to another, this places an enormous strain on countries that already have problems caring for their own populations.

When forced into squalor and deprivation—the characteristic conditions of refugee camps—children are at particular risk. One of the most serious problems is malnutrition. In 1992, refugee populations in Somalia had mortality rates very much higher than during peace. There have been widespread outbreaks of micronutrient diseases such as scurvy, beri-beri and pellagra.²² And in Angola, Liberia and the Sudan, the prevalence of wasting was more than 40 per cent. In the Goma refugee camp in eastern Zaire in 1994, a cholera epidemic killed 50,000 people in just one month.

Most refugee and displaced children travel with their families. But many lose their parents. 'Unaccompanied minors' typically account for up to 5 per cent of a refugee population, and often more—as children are lost, separated or orphaned in the panic of flight.²³ In Rwanda at the end of 1994, an estimated 114,000 children had been separated from their families.²⁴ In Angola, a 1995 UNICEF survey found that 20 per cent of children

Civil war in Rwanda separated some 114,000 children from their parents. Finding their families is a first priority for UNICEF.

UNICEF/94-0150/Photos

In Somalia, during 1992, half or more of all the children under five on 1 January were dead by 31 December.

had been separated at some time from their parents and relatives.²⁵ Almost all separations are accidental, but some are deliberate. Haitians and Vietnamese, for example, have sometimes sent children ahead in boats in the hope that the whole family will find it easier to gain asylum.

One of the most disturbing cases of lost children has emerged in the civil war in southern Sudan. Apart from the main government and opposition groups, there are also various militias that spread terror by pillaging villages and killing or seizing their inhabitants. Fearing capture or death, at least 20,000 Sudanese young people, mostly boys between the ages of 7 and 17, have fled their homes. Thousands of girls have also been killed or abducted by the raiders, but few have run away from their villages since it is more difficult for girls to envisage life outside their families. These 'lost boys' of the Sudan have been trekking enormous distances over a vast unforgiving wilderness, seeking refuge from the fighting. Hungry, frightened and weakened by sleeplessness and disease, they have crossed from the Sudan into Ethiopia and back. Many have died on the journey; most survivors are now in camps in the parched north-western plains of Kenya (Panel 3).²⁶

Not all lost children will remain on their own for long. Many who have parted from their parents are subsequently taken in by members of their extended family or community. In Mozambique, a large number of the estimated 200,000 orphaned and unaccompanied children have been absorbed by extended families, or by members of former communities or ethnic groups.²⁷ Others are likely to end up in the cities. A 1991 study in Liberia found that over 90 per cent of those children surveyed who were living or working on the streets had been

there only since the war, and over half of them said they were there because they had been separated from their families.²⁸

Famine and disease

Whether they are on their own or with their parents, most of the children who die in wartime have not been hit by bombs or bullets but have succumbed to starvation or sickness. In African wars, lack of food and medical services, combined with the stress of flight, have killed about 20 times more people than have armaments. One 1980 study in a war zone in Uganda attributed only 2 per cent of the deaths to violence—whereas 20 per cent were caused by disease and 78 per cent by hunger.²⁹ And when war is combined with drought, the death toll can be enormous: in Somalia, during 1992, half or more of all the children under five on 1 January were dead by 31 December—and around 90 per cent of these died from the interaction of malnutrition and disease.³⁰

Most such deaths arise from disruption of the normal production and distribution of food. The manipulation of food supplies has always been a significant tactic of war but has been used particularly ruthlessly of late. For example, in the early 1980s, the Ethiopian Government used scorched-earth tactics to destroy hundreds of thousands of acres of food-producing land in Tigray.³¹ And in Angola, the UNITA forces sowed large areas of land with anti-personnel mines to hamper food production in government-controlled areas, while mobilizing and relocating its own supporters to create food production bases. In many countries, grain stores have also been subject to attack by rebel and government forces.

War also hinders the distribution of food relief. Governments often

The lost boys of the Sudan

UNICEF/REUTERS/PHOTOS

Since 1983, the Sudan People's Liberation Army (SPLA) and the Sudanese Government have been at war in southern Sudan. The conflict has already claimed more than 500,000 lives and displaced huge numbers of people. Among these were at least 20,000 children, mostly boys, between 7 and 17 years of age who were separated from their families. These 'lost boys' of the Sudan trekked enormous distances over a vast unforgiving wilderness, seeking refuge from the fighting. Hungry, frightened and weakened by sleeplessness and disease, they crossed from the Sudan into Ethiopia and back, with many dying along the way. The survivors are now in camps in Kenya, the Sudan and Uganda.

This extraordinary exodus has its origins in traditional forms of migration. After being initiated into manhood, young adolescent boys in southern Sudan have generally been quite mobile. Organized into small groups of their peers, they would leave home for a period to look after cattle. Or they might head for the

towns or cities to go to school or to seek their fortune, before eventually returning home. In addition, at times of stress families all over Africa send their children elsewhere to find safety, food, work and schooling.

But during the war this process has escalated dramatically. Fearing they would be targeted as potential combatants, many boys left their villages and headed for cities such as Juba and Khartoum. Here they hoped to find work or schooling, though as these cities became saturated with migrants, the boys often had to resort to begging or petty crime.

Others set out for refugee camps in Ethiopia. Some travelled with friends or relatives, others slipped away on their own at night. Few had any idea of what lay ahead of them. They believed the trek would last only a few days and discovered that they faced a harrowing journey of 6 to 10 weeks. Continually under threat, they would flee for their lives, losing their way in the wilderness. Often they lost everything en route—blankets, sheets, shoes,

clothes and pots—to soldiers, swindlers or bandits. Many fell victim to killer diseases. Others were so weakened by hunger and lack of sleep that they could go no further and sat down by the roadside—prey for lions and other animals.

The survivors who reached the camps in Ethiopia started to lead a relatively peaceful life. But it was not to last. Following the change of government in Ethiopia in May 1991 they had to flee again, back to camps in the Sudan. This time the journey was during heavy rains, and many perished crossing the swollen rivers or were hit by aerial bombardment. The luckier ones made it to a camp where they received help from the International Committee of the Red Cross.

This relative security was shattered again late in 1991 when fighting erupted around them, and they and children from other camps were on the move once more, eventually heading for Kenya.

Since 1992, UNICEF has managed to reunite nearly 1,200 boys with their families. But approximately 17,000 remain in camps in the region. The harsh memories remain as well. As 14-year-old Simon Majok puts it: "We were suffering because of war. Some have been killed. Some have died because of hunger and disease. We children of the Sudan, we were not lucky."

Sanctions: Children hard hit in Haiti

UNICEF/Photo/Yousture

To put pressure on violent or oppressive regimes the international community has increasingly resorted to economic sanctions. These may achieve long-term benefits, but they also cost lives—usually those of the poor and vulnerable.

Following the military coup in Haiti in September 1991, the United Nations imposed economic sanctions in an effort to restore democracy and human rights. Over the three years of sanctions, the rate of malnutrition for children under five increased from 27 per cent to over 50 per cent in many health institutions; thousands of children more may have died.

Before the overthrow of Haiti's first democratically elected government in 1991, the health of the nation's children was already among the most fragile in the western hemisphere, and most of the island's people, almost 7 million, lived in poverty. Sanctions caused employment and food production to plummet and also provoked inflation, which pushed up the cost of drugs and other essential items.

Primary school enrolment dropped almost 25 per cent, as parents could no longer afford to send their children to school. Many of the wealthy and powerful were sheltered by overseas bank accounts and could buy what they needed on the black market. The poor, however, had no cushion against additional hardship.

A six-member mission from the Harvard Center for Population and Development Studies went to Haiti in July 1993 and included a visit to Maissade in the Central Plateau. Save the Children had already reported from this rural area of 45,000 people that from 1991 to 1992, when sanctions were being enforced, child mortality increased by up to 64 per cent. They also reported that between 1990 and 1993 there had been a parallel increase in the proportions of children who were moderately and severely malnourished.

In addition to shortages of food, people also suffered from the deterioration in health services. Field interviews by the Harvard team revealed that shortages of

drugs, supplies and electrical power had led to breakdowns in primary health care. Bottlenecks in public transportation also reduced access to health facilities. This led, among other things, to a decline in immunization coverage and a rise in deaths from measles and other infections. Between 1991 and 1992, the proportion of total deaths attributed to measles increased from 1 per cent to 14 per cent.

With the lifting of sanctions and the return of Haiti's President Jean-Bertrand Aristide in October 1994, a six-month-long measles eradication campaign, supported by UNICEF, immunized almost 3 million children between the ages of 9 months and 14 years, raising coverage to 95 per cent of children by August 1995. In comparison, only 20 per cent of children were covered in 1993. Many of those immunized also received vitamin A capsules and a dose of polio vaccine provided by Rotary International.

The Harvard team recommended that the international community sharpen its approach to sanctions. First, it should focus more precisely on the real targets: the military and their élite supporters—freezing overseas bank accounts, withdrawing commercial air traffic and denying visas. Second, it should take measures specifically to protect the poor. These would include guaranteeing free movement of life-saving supplies, especially of food and medicines; ensuring access to water, shelter and clothing for vulnerable groups, particularly for mothers and children; closely and impartially assessing and monitoring the welfare of innocent populations; and safeguarding aid from misuse and diversion.

Photo: Barefoot children run through water contaminated by garbage and sewage in a Port-au-Prince shanty town.

feed their armies first, distributing to the civilian populations only the food that remains. In Somalia in the 1980s, one estimate suggested that only 12 per cent of some food aid shipments reached the people for whom they were intended.³²

Not only does war interrupt the distribution of food, but it also cuts supplies of water, with particular risks in cities. The long and devastating war in Lebanon had a very damaging effect on the quantity and quality of drinking water. One 1990 study found that 66 per cent of urban water sources were contaminated and that one third of urban communities were using cesspools for sewage disposal.³³ Water can also be a weapon of war. In Sarajevo, water systems have deliberately been destroyed to isolate and break down residential neighbourhoods; during the course of the war, 30 per cent of the pumping system and 60 per cent of the water mains' piping have been ruined.³⁴

Communities at war also inevitably see attacks on their health infrastructure. In Mozambique, between 1982 and 1986, over 40 per cent of health centres were destroyed.³⁵ Health personnel are also often scattered, or may leave the country. In Uganda between 1972 and 1985, half the doctors and 80 per cent of the pharmacists abandoned the country in search of better opportunities elsewhere.

The lack of food, clean water and adequate health care in war zones exacts a terrible toll on children. For example, it is estimated that, in the period of conflict from 1980 to 1988, Angola lost 330,000 children and Mozambique 490,000 to war-related causes.³⁶

Sanctions

Many problems of nutrition and health can arise not just from military but also from economic war-

fare—as the outside world tries to put pressure on errant regimes. While the United Nations finds itself caring for war-torn communities, the Security Council is imposing economic sanctions that create many of the same problems for the poor and vulnerable—leaving the real targets virtually untouched. The Secretary-General of the United Nations himself recognizes this dilemma. In June 1995, he described sanctions as a blunt instrument. "They raise the ethical question," he said, "of whether suffering inflicted on vulnerable groups in the target country is a legitimate means of exerting pressure on political leaders whose behaviour is unlikely to be affected by the plight of their subjects."³⁷

The balance sheet of several years of sanctions against Iraq reveals a minimum of political dividends as against a high human price paid primarily by women and children. The food rationing system provides less than 60 per cent of the required daily calorie intake, the water and sanitation systems are in a state of collapse, and there is a critical shortage of life-saving drugs.³⁸ In Haiti, too, sanctions are thought to have cost the lives of thousands of children (Panel 4).

The trauma of war

Every conflict forces children to live through some terrible experiences. Indeed, millions of children have been present at events far beyond the worst nightmares of most adults. In Sarajevo, where almost one child in four has been wounded in the conflict, UNICEF conducted a survey of 1,505 children in the summer of 1993. It found that 97 per cent of the children had experienced shelling nearby, 29 per cent felt 'unbearable sorrow', and 20 per cent had terrifying dreams. Some 55 per cent had

It is estimated that, in the period of conflict from 1980 to 1988, Angola lost 330,000 children and Mozambique 490,000 to war-related causes.

Fig. 1 Angolan children in war

Some 200 children 8 to 16 years of age, one third of whom were girls, were interviewed about their war experiences in a recent study carried out by the Christian Children's Fund. Two thirds of the children were natives of Huambo and Bie provinces; the rest were from eight other provinces. The interviews took place in schools, at camps for the displaced, on the streets and in orphanages. While the children selected were from a wide range of environments, they were not a representative sample. Nevertheless, the 200 interviews report traumatic experiences undoubtedly shared by many other Angolan children.

Source: Study by Christian Children's Fund, 1995.

been shot at by snipers, and 66 per cent had been in a situation where they thought they would die.³⁹

Another survey in 1995 in Angola found that 66 per cent of children had seen people being murdered, 91 per cent had seen dead bodies, and 67 per cent had seen people being tortured, beaten or hurt. In all, more than two thirds of children had lived through events in which they had defied death.⁴⁰

This type of experience can produce a range of symptoms. After the genocide in Rwanda in 1994, Dr. Albert Nambaje, clinical psychologist at the National Trauma Recovery Centre, reported: "Among the symptoms manifested by children are nightmares, difficulty in concentrating, depression and a sense of hopelessness about the future." The UN Commission on Human Rights' Special Rapporteur on former Yugoslavia similarly reports on interviews with children: "Memories of the event remain with them... causing extreme nightmares, daily intrusive flashbacks of the traumatic events, fear, insecurity and bitterness."⁴¹

It is universally true that horrific experiences are so deeply disturbing, so overwhelming, that a child will try to suppress bad memories rather than confront them. But many trauma researchers believe that it is the repression of memories and feelings that is at the heart of trauma suffering in both the short and long term.

Time does not heal trauma. A child must be helped to express suffering and to confront bad memories, with the support and guidance of an empathetic and informed adult. The very act of talking or writing about, or even acting out, traumatic events is a way for a child to begin healing and start on the road to recovery.

Every culture has its own way of dealing with traumatic experiences.

In South-East Asia, studies of Cambodian, Lao and Vietnamese people show that each has very different conceptions of psychosocial distress. And much also depends on the family circumstances of the children, as well as on their age and the nature of their exposure to traumatic events.

In all cultures, one of the most important factors is the cohesion of the family and community, and the degree of nurture and support that children receive. Indeed, one of the most significant war traumas of all, particularly for younger children, is simply separation from parents—often more distressing than the war activities themselves.⁴²

Adolescents also face particular problems. They are at a time of life when they are undergoing many physical and emotional changes. In some ways, they are even more vulnerable than younger children since they recognize better the significance of the events unfolding around them. Aid workers in Bosnia and Herzegovina have been encountering adolescents who have 'weeping crises', who attempt suicide, who are in a state of depression and who have increased levels of aggression and delinquency.⁴³

Military expenditure—the opportunity cost

Even if they have never seen a gun, millions of children suffer from wars, as resources that could have been invested in development are diverted into armaments. Indeed, one of the most distressing realities of our time is that most wars have been fought in precisely those countries that could least afford them. In 1993, there were 42 countries with major conflicts and another 37 that were suffering from some kind of political violence. Of these 79 countries, 65 were in the developing world.⁴⁴ And military spending

globally in 1993 was estimated to be US\$790 billion, of which US\$121 billion was spent in developing countries.

It seems clear that poverty and lack of development fuel hatred and escalate hostilities, and that improvements in such areas as nutrition, health, education, water, sanitation and family planning would go far to reduce the underlying causes of so many wars. The year 2000 goals for children, which call for an assault on poverty and underdevelopment through advancement in these areas, could be achieved for US\$30 billion to US\$40 billion a year more than is currently spent.

By any reasonable international perspective, this seems a relatively small sum of money. Consider the decline in military expenditures from 1987 to 1994: cumulative savings of nearly a trillion dollars.⁴⁵ This should have meant a transfer of sizeable sums of money to social, economic and environmental programmes. Instead, it appears that virtually all of these savings have gone to budget deficit reductions and non-development expenditures. This seems an extremely short-sighted policy.

At the same time, despite the overall global decline, large amounts of scarce resources continue to be devoted to armaments. Between 1960 and 1991, total annual military expenditures by developing countries rose from US\$27 billion to US\$121 billion.⁴⁶ Sadly enough, some of the steepest increases occurred in the poorest countries. Angola, Ethiopia, Mozambique, Myanmar, Somalia and Yemen have for many years spent more on their military than they have on their people's education and health. Money spent on arms could have been put to much better use. The United Nations Development Programme (UNDP) has estimated that

redirecting just one quarter of developing countries' military expenditure could have provided the additional resources to implement most of the year 2000 programme: primary health care for all, immunization of all children, elimination of severe malnutrition, provision of safe drinking water for all, universal primary education, reduction of illiteracy, and family planning.⁴⁷

In recent years, however, there has been, as noted, some limited improvement in both developing and industrialized countries. As a result, a trend has emerged showing a global drop in military expenditures and an upturn in social spending (Figures 2, 3). Eritrea, Ethiopia, Mozambique, Uganda and Zimbabwe are examples of developing countries that have managed to reallocate their budgets.

Yet, distorted priorities remain and the industrialized countries must share responsibility since they are the dominant arms suppliers. The top five exporters to developing countries are the five permanent members of the United Nations Security Council. With the end of the cold war, the weapons industries in the rich countries are scrambling for new markets wherever they can find them—often with the enthusiastic support of their political leaders.

While arms sales have dropped significantly in the last few years, sales to developing countries in 1994 still amounted to US\$25.4 billion, all of which is money lost to development efforts. The largest single supplier has normally been the US, though in 1994 France acquired that dubious distinction: its sales rose from US\$3.8 billion in 1993 to US\$11.4 billion in 1994.⁴⁸

While these sales are largely of expensive hardware such as submarines or sophisticated fighter aircraft, much of the damage is now done by light weapons and smaller

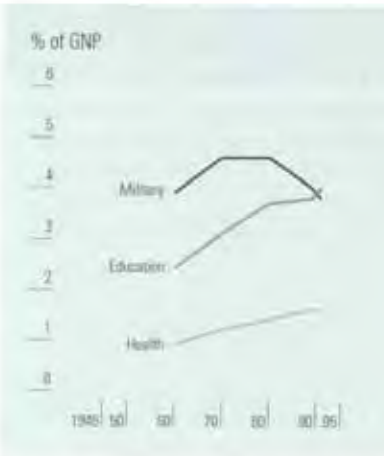

Children are at particular risk from malnutrition because of war. A study in a war zone attributed only 2 per cent of deaths to violence; most are caused by the interaction of malnutrition and infection.

Fig. 2 Industrialized countries spending more on health and education, less on military

As a percentage of GNP, public spending on the military in industrialized countries has fallen by 40 per cent since 1960, health and education spending has been higher for at least 15 years.

Fig. 3 Public spending on military in developing countries outpaces health funding

Military spending as a percentage of GNP has also declined in developing countries; expenditures on education almost equal those for the military. Health expenditures remain much lower.

Source for both figures: Sivard, R.L., *World military and social expenditures 1993*. Washington, D.C., 1993.

arms. Relatively little is known about the international trade in small arms, which often operates through the informal sector and powerful criminal networks. It is clear that in war zones weapons have been accumulating over decades. The arms on sale in the bazaars of Afghanistan, northern India and Pakistan, for example, are a legacy of the Soviet invasion of Afghanistan in 1979 and of the US pipeline of arms to the Afghan guerrilla groups. Similarly, the arms used in Somalia's civil war had been supplied to the previous regime by the US and the Soviet Union. And more recently, the arms used by the Government of Bosnia and Herzegovina include light weapons left over from the Lebanese civil war.⁴⁹

It is therefore appropriate to repeat a tragically consistent theme in UNICEF reports on the state of the world's children: if even a fraction of the resources devoted to building military capacity could be diverted to achieving basic development goals, we would soon be living in a world with fewer social and environmental problems and far fewer and less destructive wars.

The legacy of land-mines

Of all the weapons that have accumulated over years of war, few are more persistent and more lethal to children than land-mines. Hundreds of thousands of children, herding animals, planting crops or just playing, have been killed or maimed by these deadly devices.

Since 1975, land-mines have exploded under more than 1 million people and are currently thought to be killing 800 people a month. There seems little prospect of any end to the carnage. In 64 countries around the world, there are an estimated 110 million land-mines still lodged in the ground—waiting.⁵⁰

They remain active for decades. As one Khmer Rouge general put it, a land-mine is a perfect soldier: "Ever courageous, never sleeps, never misses."

There are basically two types of land-mines: anti-tank and anti-personnel. The most dangerous to children are the anti-personnel mines that explode even under the gentle pressure of a child's hand or foot. These come in a bewildering array of shapes and colours. Some look like stones, others like pineapples. But all can seem an interesting discovery for a curious child. One of the most infamous is the 'butterfly' mine, designed to float to the ground from helicopters without exploding, but with a shape and colour that also make it a deadly toy.

Virtually all combatants use land-mines. During the Persian Gulf war, the US and its allies laid about 1 million mines along the Iraq-Kuwait border and around the Iraqi city of Basra. And some 3 million have been laid in the continuing Balkan war. Some of the largest numbers lie in wait in Africa and Asia. The countries most devastated by land-mines are probably Afghanistan, Angola and Cambodia. Afghanistan has an estimated 10-15 million mines in place.⁵¹ It is clear that many of these have been randomly scattered in inhabited areas precisely to cause civilian casualties and terrorize the population.⁵²

Adults caught in the blast of an anti-personnel mine often survive with treatment, though they usually lose a limb. Children are less likely to survive because their bodies are so vulnerable. Those who do live will be seriously injured. A child may lose one or both legs or arms and sustain serious injuries to the genitals and abdomen. Shrapnel may also cause blindness and disfigurement. All of this happens in countries that have difficulty

Combating land-mines in El Salvador

UNICEF/USA Parents

In January 1992, peace accords between the Salvadorian Armed Forces and the Farabundo Martí National Liberation Front (FMLN) ended 12 years of bitter civil war. But while the guns had been silenced, the land-mines remained. Adults working in the fields and children picking up interesting-looking objects continued to become victims of war.

UNICEF brought the two parties together again a few months later to join forces against this continuing threat. One of the first priorities of this Mine Awareness and Accident Prevention Project was to try to locate the mines. Both sides provided maps, and within two months 425 minefields had been fenced off for public protection. Even so, the locations of many of the mines were unknown—the army had dropped some by air, and independent FMLN units had laid others but kept no records.

The second task was to warn the population. The army and the FMLN provided samples of their mines, and UNICEF produced thousands of posters that were dis-

tributed with illustrations of these devices and instructions on what people should do if they encountered a mine or any other unexploded device: "Don't touch. Mark the place. Turn around and leave the way you came. Tell the authorities."

The posters were reinforced by an education and public awareness campaign, through the press, television and radio. But each community also needed individual contact. A team of educators travelled around meeting teachers, health promoters and NGO staff. These volunteers were trained in mine awareness so they could serve as 'multipliers'—visiting rural communities, giving talks illustrated by flip charts and distributing leaflets to each family. Between October 1992 and December 1993, over 3,600 multipliers spoke to an estimated 300,000 people—representing 44 per cent of the population in high-risk areas.

These campaigns certainly brought the message home. One problem had been that farmers were removing the mine-warning signs because they desper-

ately needed the land to grow their crops. Others took the wooden stakes on which the signs were mounted to build furniture or use as firewood. After an intensive education campaign, all the stakes were replaced. The only casualties were the cattle that the farmers sent ahead to serve as mine detectors.

The other main component of the project was deactivating as many mines as possible. The Salvadorian Government hired a Belgian firm, which during 1993 and early 1994 deactivated a total of 9,511 mines. The company also trained 240 armed forces engineers and 240 FMLN members in mine detection.

As a result, the number of deaths attributed to land-mines and other explosives has fallen dramatically. In 1992, there were 579 victims; in 1993 this fell to 259, of which only one was attributable to a land-mine. Between January 1994 and May 1995, there was not a single reported accident involving a land-mine. There are, however, still risks from unexploded rockets, grenades, bombs and other devices. A second phase of the programme is now warning people of these dangers.

The mine clearance campaign has had strong local support. The Government has been committed to this programme and has borne the entire cost of mine clearance—more than US\$4.8 million. The campaign has also benefited from a growing spirit of cooperation between two armies that were often deeply suspicious of each other. This successful programme, which combined mine clearance with mine awareness activities and education, will hopefully serve as a model for other countries afflicted by mines and living with this ever-present danger.

Photo: A young boy teaches younger friends how to avoid lethal land-mines.

offering the simplest medicines or pain-killers, let alone artificial limbs. In El Salvador, fewer than 20 per cent of child victims receive any kind of remedial therapy; the rest have had to fend for themselves as best they can—often begging or stealing to survive.

Land-mines cause enormous pain and suffering but they also bring lingering economic and social costs. In addition to the expense of medical treatment, and the cost to families of caring for injured relatives, they also hinder the flow of goods and people, and put huge areas of agricultural land out of production. In addition, the availability of land-mines contributes to the permanent 'militarization' of daily life. So common are they in Cambodia that they are now used for fishing, or as property security devices, or even to settle domestic disputes.

Land-mines can be cleared—but only laboriously and at enormous expense. Ironically, these weapons that can cost less than US\$3 each to manufacture can cost up to US\$1,000 each to clear. Trained workers have to crawl their way along, probing the soil ahead, inch by inch. One person can clear only 20 to 50 square metres per day.

The international community is slowly realizing the implications of a world studded with land-mines. Unfortunately, it has not been sufficiently shocked to take effective action. In 1993, it allocated only US\$70 million for mine clearance in countries such as Afghanistan, Bosnia and Herzegovina, Cambodia, Croatia and Mozambique. In the same year, however, a further 2 million mines were laid—leaving a 'de-mining deficit' of 1.9 million mines, and adding some US\$1.4 billion to the future cost of clearance.

Apart from the demand for mines from combatants, one of the major problems is that dozens of companies around the world, many of

them household names, are still content to manufacture and sell these destructive devices. An increasing revulsion at this trade is encouraging a number of organizations to refuse to do business with companies involved in the sale or production of such weapons. Among United Nations organizations, UNICEF has joined the Office of the United Nations High Commissioner for Refugees (UNHCR) in supporting such a boycott.

At the time of the announcement of the boycott, Sadako Ogata, United Nations High Commissioner for Refugees, dealt with land-mines squarely: "For my part, I see little difference between those who use them and those who produce them....Whatever the present legality of manufacturing such weapons, the toll they take on innocent civilians amounts to a crime against humankind."⁵³

A continuum of violence

It is shocking enough that children are blown up by mines, fighting on the front lines, or falling victim to famine or disease in refugee camps. But open warfare is only part of a much broader picture of violence against children.

Millions of other children struggle to survive in close-to-battlefield conditions on the streets of the world's cities—from Los Angeles to São Paulo to Manila. Guns and knives and fights are chilling parts of daily life. In the US, gang violence, often drug-related, is drawing in ever-younger children. In urban areas around the world, children spend their days begging or cleaning car windows—numbing their pain by inhaling chemical solvents or glue. And in some Latin American countries, businessmen have paid off-duty policemen, security guards, or professional killers to

UNICEF/5526/HA06

Land-mines are catastrophic for children, whose small bodies are particularly vulnerable to the injuries they inflict. One of the most heavily mined countries in the world is Afghanistan.

eliminate street children they consider a nuisance.

Millions of other children suffer from the collapse of public services. The governments of many developing countries, in the face of deepening economic crises and under pressures of structural adjustment, have cut health and education services and reduced food subsidies. While there may be longer-term benefits to elements of adjustment, the costs to today's families and children have been immense.

This violent environment not only adds to human suffering, but also contains the seeds of future conflict. All of what are now seen as 'complex emergencies' have their roots deep in long-running social, political and economic crises. Even those disputes that appear most surprising have clear antecedents. The outbreaks of violence in Chiapas in Mexico in 1994 came as less of a surprise to those who lived there and knew of the sharp divide between the indigenous people of Chiapas and the rest of the country. Their state provides one fifth of the country's electricity and one third of its coffee, yet the Mayan population there lives close to destitution.⁵⁴

Such pressures have built up over generations, but the world is clearly moving into a much more fluid era in which underlying tensions are erupting to the surface.

The collapse of communism, the end of the cold war and the extension of liberal democracy have all combined to create a much more volatile situation as people regroup in different political formations.

There is also greater economic uncertainty. The steady globalization of international finance and trade may be creating wealth for some, but for millions of others it is leading to conditions of marginalization and social disintegration. And industrialized countries have been increasingly reluctant to meet

the financial shortfalls with aid. Development assistance actually fell in 1993 for the first time in several years. This is a particularly serious development for Africa, which finds it difficult to attract private funds.

Pointing out the chronic nature of many of these crises is not a counsel of despair. What it does, in fact, suggest is that unless these underlying issues are addressed, future generations of children will live in a constant state of war. The response has to take place at many levels simultaneously: legal, economic and political.

International protections

The world should, in theory, be in a stronger position to shield children since the principles of protection for children in wartime have been established in a number of international conventions.

A series of Geneva Conventions after World War I dealt with different aspects of the conduct of war by combatants. It was not until after the atrocities of World War II that the international community specifically addressed non-combatants and produced in 1949 another series of four Conventions, the last of which called for the protection of civilians in time of war (Fourth Geneva Convention, referred to below as 4GC). In 1977, this was supplemented by two Additional Protocols (referred to below as PI and PII) which provided children with special protection—dealing, for example, for the first time with their participation as soldiers. The issues covered by these treaties include:

► *General protection of civilians*—Civilians are entitled to general protection against the dangers from military operations. They shall not be the object of indiscriminate

In the destroyed Bosnian city of Mostar, a street sign alerting motorists to school-children still stands, riddled with bullet holes.

Fig. 4 Net investments and assistance

Net resource flows to developing countries, in US\$ billions at 1992 prices and exchange rates, have increased since 1985, chiefly from private flows rather than official development financing.

attack, acts or threats of violence (PI, article 51).

► *Supplies for children and mothers*—[Combatants should] allow the free passage of medical supplies, food and clothing for children, expectant mothers, maternity cases and nursing mothers (4GC, articles 23 and 55).

► *Starvation of civilians*—It is prohibited to attack, destroy, remove or render useless foodstuffs, crops, livestock, drinking water installations and supplies and irrigation works, etc. (PII, article 14).

► *Sexual exploitation*—Children shall be the object of special respect and shall be protected against any form of indecent assault (PI, article 77).

► *Unaccompanied children*—The parties to the conflict shall endeavour to ensure that children who have been separated from their families are not left to their own resources (4GC, article 24).

In 1989, a major new human rights instrument was introduced: the Convention on the Rights of the Child. This provides for much more complete protection of the child—defining standards of how children should and should not be treated. Indeed, the principles, the provisions and the procedures of the Convention are particularly relevant at time of war when all the rights of the child are at risk.

Articles of the Convention that are especially important in wartime include all those related to survival and to family support, as well as those concerned with education, health care and adequate nutrition. Other rights that are particularly at risk include rights to:

- *protection against exploitation and violence;*
- *protection against torture, or any other cruel, inhuman or degrading treatment or punishment;*
- *family reunification;*
- *a name and nationality.*

The Convention also makes specific mention of children in war. Article 38 calls on States Parties (i.e. governments) to apply the rules of international humanitarian law that are relevant to the child, and to take every feasible measure “to ensure protection and care of children who are affected by armed conflict.”

Article 38 also urges governments to take all feasible measures to ensure that children under 15 have no direct part in the hostilities. Specifically with respect to child soldiers, it states:

States Parties shall refrain from recruiting any person who has not attained the age of fifteen years into their armed forces. In recruiting among those persons who have attained the age of fifteen years but who have not attained the age of eighteen years, States Parties shall endeavour to give priority to those who are oldest.

There was some controversy over this article in the drafting process. Many non-governmental organizations (NGOs), in particular, felt that the age limit was set too low. However, this debate has continued, and a United Nations working group has been established to draft an Optional Protocol to the Convention which would ban recruiting anyone below the age of 18.

Article 39 of the Convention also covers children in armed conflicts. It refers to the need for physical and psychological recovery and social reintegration of child victims.

Given the extent to which these principles have been flouted, it is easy to deride the existing body of international law. But these conventions are genuine landmarks. As late as World War II even the idea of extending any form of protection to enemy civilians was received with incomprehension. And the conventions do have some practical impact. While they may not prevent

military abuses, they achieve some degree of restraint. Politicians who know that there are standards against which they can subsequently be judged are more likely to consider those standards in their calculations.

Clearly what is lacking, however, are the mechanisms and the will for enforcement. In some ways, enforcement has become more difficult in recent years. In the days when many conflicts were proxy wars, international agencies such as the International Committee of the Red Cross (ICRC) could make complaints not just to the combatants but also to Moscow or Washington. Now that these alignments have disappeared it is more difficult to apply external pressure. The issue is further complicated because the conventions apply to 'States Parties'. In today's armed conflicts, many of the offenders are not States at all but rather a loose collection of subnational groups, civilian and military, and in certain instances 'non-States Parties' have argued that they are not bound by the provisions of such conventions.

Nevertheless, many of the worst offenders are governments, and should be held to account. When politicians and military leaders know that retribution is not only possible but also likely, then the inhuman and impersonal decree of mass slaughter and genocide carries a much more personal dimension.

Encouraging compliance with international law requires first that any abuses are systematically monitored and that evidence is collected. It also requires a determination to prosecute offenders. Justice needs to be re-established if ordinary people are to have confidence in their reconstituted society. This is obviously difficult to do during the heat of conflict. And it is often even more difficult when the conflict is over and countries are desperate to

achieve national reconciliation. But granting immunity for war crimes comes dangerously close to condoning them. Along with war crimes there is also the issue of reparations for abuses suffered, for enforced prostitution of prisoners or for the physical damage suffered as a result of spraying chemicals such as Agent Orange.

The power of information

Today the world benefits from swifter and denser networks of communications—making it much more difficult to cover up abuses. At present there are some 145 commercial communications satellites carrying millions of conversations, data streams and news reports around the globe.⁵⁵ While in the Biafran war in 1967 it took two days for film about the war to travel from Africa to Western television screens, nowadays a reporter has to do little more than use a computer to send news and pictures back to base for instant onward transmission around the world.⁵⁶

Yet the flow of information is far from perfect. The media are very selective about where they invest their time and money, and the cult of 'instantaneity' that technology encourages can flatten information into a homogenous stream of violent images and instant analysis. Nor is news reporting independent of the events under observation. Wars have always involved propaganda offensives alongside military ones. Much military strategy nowadays is directed towards capturing not just territory but headlines.

Aid agencies also get caught up in the media game. In Somalia, the first resort of most reporters unfamiliar with the events was to interview Western aid workers. Apart from often giving a one-sided picture, it raises the possibility that

Fig. 4 Net investments and assistance (continued)

Asia and Central and South America have benefited most from private flows. Sub-Saharan Africa, which does not attract much in private flows, has suffered a decline in overall terms.

Source for four figures: OECD, Development Co-operation—1994 report, Paris, 1995.

How Sri Lanka educates children for peace

UNICEF/REZZ/Flowers

Sri Lanka has suffered from a civil war for the past 11 years. This is a struggle that has permeated the life of the whole country, including the education system: most schools are now segregated along language lines, except for a few in urban areas.

To help children learn non-violent ways of resolving disputes, the Government, with UNICEF's help, launched a programme called 'Education for Conflict Resolution' (ECR). Initially, a core group of resource persons were trained at the National Institute of Education in some of the different forms of conflict resolution being used in other countries. They subsequently adapted these and developed their own methods appropriate to Sri Lanka—producing 10 different training manuals aimed at principals, teacher trainers, teachers and pupils.

Although some of the techniques were innovative, many of the ideas of conflict resolution struck familiar chords in Sri Lankan culture. For example, the methods of conflict resolution present aggression

and passivity as two extremes and suggest that a better, middle, way is assertiveness. Buddhism, one of the major religions in Sri Lanka, is very much in sympathy with this: it, too, emphasizes the importance of taking the middle path. And Sri Lankan village life has traditionally operated on cooperative principles, so when the trainers suggest cooperative behaviour, it is more a question of helping people reinforce old skills, rather than teaching them new ones. The Buddhist and Hindu emphasis on harmony with the natural environment is also in tune with this approach.

Similarly, Hinduism and Buddhism make extensive use of meditation. ECR has incorporated meditation, though not for religious purposes; its aim, rather, is to calm and concentrate the mind to create a sense of inner peace. A typical lesson for primary schoolchildren, for example, would start with meditation, and then cover issues such as decision-making and conflict resolution. Role-playing is an important part of the approach, and children

are encouraged to express emotions through stories, songs and poetry.

The focal point for training teachers in these principles is the Nilwala College of Education. Here, student teachers learn to integrate ideas and methods of conflict resolution into all subject areas. For example, a social studies lesson might focus on how different groups need to work together for a community to function. Within that lesson, students would be encouraged to act out a traditional story with a theme of peace and cooperation. In one such story, students pretend to be birds that have been captured by a boy with a net. When the boy goes home to find a sack in which to put the birds, they twitter with alarm at the prospect of being eaten and wonder what to do. Then one bird suggests that maybe they could fly away if they all worked together. The children then flap their arms like birds in flight and lift the net above their heads until everyone is free. Teachers learn to discuss the messages of stories with their students and help them to draw parallels between them and their own lives.

In 1992-1994, the ECR project trained 3,500 principals, 500 master teachers, 3,000 teachers and 7,500 student leaders, who in turn have reached approximately 420,000 of Sri Lanka's 4.5 million schoolchildren.

ECR is not limited to particular lessons on 'conflict resolution'; rather, it is integrated into the entire curriculum. Nor will ECR be confined to schools. In 1995, ECR began a media campaign to extend these ideas to parents and to the community as a whole.

Photo: Young Sri Lankans in school, where conflict resolution is part of the curriculum.

agencies may use publicity opportunities for fund-raising purposes.

Despite the reservations, modern media have certainly opened up channels that do allow both local people and international agencies the opportunity to get the information out and touch the world's conscience.

The possibilities for prevention

The underlying tensions that eventually erupt in violence are often easy enough to identify. As Peter Hansen, United Nations Under-Secretary-General for Humanitarian Affairs, recently noted, "Given our awareness of the circumstances and conditions which generate marginalization and vulnerability, exploit differences and exacerbate tensions, one need not be an Einstein to determine that tackling root causes is the only answer if we're serious about preventing conflict."⁵⁷

An obvious way, then, to prevent conflict is to reduce tensions. It could be argued that the reason many countries have not fallen victim to widespread violence is precisely because they have pursued policies of more equitable development and effective social integration.

Malaysia, for example, is ethnically diverse. The majority are the indigenous Bumiputra population, but 30 per cent are Chinese and another 8 per cent Indian. Following race riots in 1969, the Government introduced clear policies to distribute the benefits of economic growth more equitably and thus reduce the potential for social tension.⁵⁸

An effective way of reducing tension is to ensure equal opportunities for all children. Meeting their needs and investing in their healthy development is the foundation for more stable societies.

Children themselves of course have an important contribution to make—in trying to avoid the mistakes of their parents. Schools can foster these ideals through courses that allow children to explore ways of resolving disputes between individuals and communities that do not rely on violence. 'Education for peace' is often thought of as a form of reconciliation after war is over, but it also has potential for prevention (Panel 6).

Many parts of the world are already in an unstable situation where violence seems a likely outcome. In these circumstances, the international community needs effective early warning systems to permit speedy mediation. A number of international NGOs, notably the human rights organizations, perform a valuable service. However, receiving a warning and acting on it are two different matters.

As United Nations Secretary-General Boutros Boutros-Ghali has observed: "The whole idea of preventive diplomacy is something new and thus not readily accepted. It is like the introduction many years ago of insurance for your car. People were at first not ready to spend money on an accident that might never happen."⁵⁹

After Rwanda, where serious observers still fear a renewed outbreak of genocidal strife, the contiguous country at high risk is Burundi, where the United Nations currently has people on the ground monitoring the situation. Thus far, the presence of the Secretary-General's Special Envoy and the deployment of human rights monitors, along with a mission from the Organization of African Unity, may have helped reduce the toll from ethnic fighting. Even in this case, however, the UN Centre for Human Rights has found it difficult to raise sufficient funds to pay for the monitors it needs.

Fig. 5 War and war-related deaths

The number of deaths from wars and related causes has averaged around 400,000 per year for all developing countries, with little change between 1945 and 1992.

But the toll varies greatly by region, with deaths falling dramatically in East Asia and the Pacific from 1945 to 1992, but increasing in sub-Saharan Africa and the Middle East and North Africa during the same period.

Source: Svard, R. L. *World military and social expenditures 1993*. Washington, D.C., 1993.

Note: Long-term trends in these charts were calculated using a moving average over several years.

In the 1980s, the idea emerged of children as a 'conflict-free zone'—that children should be protected from harm and provided with the essential services to ensure their survival and well-being.

Children as zones of peace

This report has focused on the increasingly damaging impact of warfare on children—on children as victims and combatants, on the ways in which international conventions have been flouted, and on the prospects for further deterioration as more and more States dissolve into sites of chronic violence. This is an area which will be further explored in the 'Study of the Impact of Armed Conflict on Children' by a high-level commission established by the UN General Assembly and chaired by Graça Machel, former First Lady of Mozambique (Panel 7).

The average viewer of the nightly news might not be too surprised at what is happening to children. War is seldom absent from our television screens. And the fact that all these things are being visited on children might be seen as yet another regrettable but inevitable aspect of humanity's capacity for violence.

But there is also a special reason for focusing on children. Most adults feel a particular shock and outrage when they see the bodies of children slain in battle or wasting away in refugee camps. They believe that children should somehow be above the political divide.

This concern is of more than sentimental value. It has frequently allowed relief to penetrate enemy lines to reach starving children beyond.

After World War I, Eglantyne Jebb, one of the founders of the British Save the Children Fund, who had organized food for needy children on both sides of the conflict, was charged in the United Kingdom with having given aid and succour to the enemy. "My Lord," she is said to have responded, "I have no enemies below the age of

11." She was acquitted.⁶⁰ Similarly during World War II, the establishment of what is now Oxfam was based on defiance of official opposition to aiding civilians in Belgium and Greece who were suffering from the Allied blockade.

UNICEF, too, as Chapter II of this report explains, has since 1946 frequently used its focus on children as a means of working on both sides in civil wars—as it did in the 1960s in Biafra, and later in the 1970s in what was then Kampuchea. However, it was not until the 1980s that the idea emerged of children as a 'conflict-free zone'—that children should be protected from harm and provided with the essential services to ensure their survival and well-being. That concept was first formulated in 1983 by Nils Thedin of Sweden in a proposal to UNICEF. If ever an idea seemed quixotic, this was it.

To expect the perpetrators of some of the most sadistic actions to stop and think about children initially made little sense. Until it was tried. Since Nils Thedin's proposal, a half-dozen corridors of peace, days of tranquillity, bubbles of peace—different names for the same phenomenon—have actually been negotiated in the midst of a number of bloody conflicts.

The first occasion was in El Salvador in 1985. After much negotiation with the Government and the rebels, there was finally agreement that the carnage should stop for three 'days of tranquillity'.

On three days in consecutive months, the Salvadorian conflict gave way to a campaign in which as many as 20,000 health workers immunized 250,000 small children against polio, measles, diphtheria, tetanus and whooping cough. This process was repeated every year until the end of the war six years later.

Similar principles have been

Impact of war on children: Study by high-level group

UNICEF/PAUL COMPTON

In late 1993, the United Nations Secretary-General, through a General Assembly resolution, launched a two-year study of the impact of war on children, to be headed by Graça Machel, former First Lady of Mozambique.

In an address to the UN in 1994, she promised that the study's report would be "uncompromising" in its candour. Speaking at a session of the Commission on Human Rights in Geneva, Ms. Machel said, "Violations of child rights and humanitarian law applicable to children are widespread and serious. Incidents of rape, torture, and the murder of child civilians mock the binding promises made by States in their adherence to the Convention on the Rights of the Child."

Ms. Machel is being supported by a group of eminent persons consisting of Hanan Ashrawi (Palestine), Belisario Betancourt (Colombia), Francis Deng (Sudan), Marian Wright Edelman (US), Devaki Jain (India), Rigoberta Menchu (Guatemala), Julius Nyerere (Tanzania), Lisbet Palme (Sweden), Wole Soyinka

(Nigeria) and Archbishop Desmond Tutu (South Africa). Support for the study is coming from all parts of the UN system, with UNICEF and the Geneva-based Centre for Human Rights playing lead roles. There is also a worldwide network of participating NGOs.

The group is undertaking a series of regional consultations in Africa, Asia, Europe, Latin America and the Caribbean and the Middle East, making field visits to several affected countries and commissioning a significant number of research papers.

The first of two African consultations took place in Addis Ababa in April 1995. Participants noted the "totality" of today's wars, in which political leaders manipulate accidental distinctions of race, class or ethnicity—forcing the participation of every man, woman and child. Some were concerned about confusion regarding the UN mandate to intervene when governments are unwilling or unable to protect the rights of their people. The meeting agreed that all warring parties must stop

recruiting or otherwise using children to achieve military objectives; demobilize child soldiers and integrate them into civilian life; protect non-combatants in areas of conflict, especially children and women; protect traditional sanctuaries, such as schools, hospitals and churches, and stop their selection as military targets.

The group will present its findings and a series of recommendations to the United Nations General Assembly in 1996.

"All of us," says Ms. Machel, "find it hard to believe that at the end of the 20th century, children are targets, children are expendable, children are victims, children are refugees, and even perpetrators—in one conflict after another, on virtually every continent."

She also believes, however, that there is a way out of the crisis. "I am under no illusions about the size of the task. But with the necessary political will, substantial progress can be made towards our common goal of making the rights of children in situations of armed conflict the rule rather than the exception...the task that we face is indeed a challenging one. But the cost of failure—for this generation's children and the next—is simply too high to bear."

Photo: A mother and her 10-year-old amputee son in Mostar are victims of modern warfare.

UNICEF/1985/Ima 250

El Salvador in 1985 saw the first 'days of tranquillity', when the fighting stopped for three days to allow 250,000 small children to be vaccinated.

applied in other disputes. In 1986, in the war between the Ugandan Government and the National Resistance Army, the warring parties agreed to allow vaccines, personnel and equipment to travel along a corridor of peace. A few months later in Lebanon, in March 1987, hostilities were suspended for three days to permit all young children to be vaccinated. Two years later in Afghanistan, in 1988-1989, vaccination teams operated in both government- and mujahidin-controlled territories and in some areas raised vaccination levels above 80 per cent.

Probably the most sustained example of humanitarian aid working on both sides of a conflict has been in the Sudan. The Sudan for years had been racked by civil war, but during 1988 this had been compounded by a disastrous drought causing the loss of 250,000 lives and displacing nearly 3 million people. By January 1989, it was clear that a similar tragedy lay in store for the following year. The Secretary-General asked UNICEF Executive Director James P. Grant to meet with the warring parties—and Operation Lifeline Sudan (OLS) was the result. Through OLS the relief agencies negotiated both with the Government and the rebel Sudan People's Liberation Army (SPLA), which agreed to allow eight 'corridors' of relief to be created.

In the face of enormous odds, OLS achieved significant results. By the end of September that year, it had delivered over 100,000 metric tons of food and 4,000 tons of medical supplies.⁶¹ At the same time, vaccination clinics became operational in all the garrison towns and reached 90,000 children in SPLA areas.

OLS also brought about a reduction in the fighting—at least along the corridors of tranquillity. It allowed people to move about the

countryside, and above all it gave people hope. Even after hostilities were resumed, civilian despair was never again to be so widespread or intense. A second phase was negotiated in March 1990 and, within the limits imposed by the fighting, has been running ever since. In 1995, the SPLA became the first combatant group in dispute with a recognized government to commit itself to abide by the provisions of the Convention on the Rights of the Child.

A new age of development uncertainty

The experience in the Sudan illustrates a pattern that is currently being replicated in many countries in Africa, the Middle East, the Balkans and Central Asia. In the past, civil wars usually ended with outright victory by one side. Nowadays, however, the conclusion is less clear cut. War and peace have an uneasy coexistence: fighting may stop in one place but linger sporadically elsewhere. And even after peace is declared, fighting may flare up again at any time.

This blurring of the distinction between war and peace is matched by a corresponding ambiguity in the programmes of aid agencies—uncertain about whether they should be aiming for short-term relief or long-term development. Most agencies have long agonized about seeing their long-term objectives interrupted by demands that they respond immediately to emergencies. These chronic conflicts are adding new dimensions to this conundrum.

At first glance, it does look as though the answer has simply been to increase relief. At the global level, the proportion of official development assistance devoted to emergencies has certainly been rising. And while in the early

1970s, much of this assistance was on a government-to-government basis, an increasing proportion of emergency aid in recent years has been passing through NGOs and the United Nations agencies. UNICEF's expenditure on emergencies between 1987 and 1993 rose from 7 per cent to 28 per cent, before declining slightly in 1994.⁶²

These statistics are based on a supposedly clear distinction between emergency relief and development aid. However, these categories are often blurred. It is not clear that immunizing a child in a refugee camp counts as relief rather than development. And a borehole sunk near a refugee camp could later be used by the local community—and thus be seen as investment in rural water supplies.

In the case of chronic conflicts there is a further reason to set such categories aside—and reject the notion of relief first, development later. When the emergency is a climatic disaster, relief agencies work on the assumption that normal government services will later be resumed. In long-standing, conflict-related emergencies this assumption breaks down because a central element of the crisis is that many forms of governance have totally collapsed. In developing countries where the State is already weak, endless years of strife have only served to further undermine already frail public services.

In these circumstances, it is vital that relief does not inhibit recovery. Massive flows of emergency aid controlled by outside agencies may be the only way of feeding people in time. This form of assistance could displace already weakened government services and further compound the crisis. Relief and development activities ideally should be pursued simultaneously—and both should be seen as opportunities to build long-term capacity.

In politically complex and ambiguous circumstances, this is difficult to achieve but by no means impossible. It does, however, mean carefully assessing the strengths and weaknesses of existing institutions and making the best use of them. In Haiti, UN agencies and NGOs were able to make some contribution to development, but not in any way that would strengthen the illegal regime. Obligated to bypass the Government, they were nevertheless able to arrange for considerable amounts of food, fuel, water and medical supplies to be directly managed and controlled by communities and churches. This sustained capacity at the community level helped pull Haiti through its initial period after the restoration of democracy.

War relief for children

Healing the wounds of war-torn societies is a long and difficult undertaking. The immediate demand is to ensure that people, and especially children, are adequately fed, have access to safe water and are protected against disease. But recent experience has underlined the importance of five other tasks: caring for unaccompanied children; demobilizing child soldiers; healing the mental wounds of war; restarting schools; and embarking on education for peace.

► *Unaccompanied children*—One of the most urgent tasks is attending to the needs of unaccompanied children. In 1994, an estimated 114,000 Rwandese children were lost, abandoned, orphaned or otherwise separated from their parents. Some 70,000 were displaced within Rwanda, while most of the remainder crossed the border into Tanzania or Zaire. Many of these children were taken in by other families—some families took up to 9 or 10 children. Some children ended up in

Relief and development activities ideally should be pursued simultaneously—and both should be seen as opportunities to build long-term capacity.

makeshift centres or former orphanages. Others ended up in special centres set aside for unaccompanied children in refugee camps. One of the risks of offering specific facilities for such children, however, is that their parents may be tempted to deliberately abandon their children in the hope that they will be better cared for by others.

The ultimate aim, of course, should be to reunite children with their families. In Rwanda, Save the Children, UNICEF, UNHCR and other partners have arranged with ICRC to standardize the process of data collection and tracing. This has included working with the Kodak company to enter photos of the children along with their details into computers and distributing print-outs throughout the refugee camps. This kind of activity can be supplemented with information broadcast by radio. ICRC and the British Broadcasting Corporation have launched this type of tracing programme in Uganda. And the organization Doctors Without Borders has a similar programme with Radio Agatachya in Zaire. If the parents cannot be found, then members of the extended family are sought. Failing this, attempts are made to arrange for fostering or adoption by families from the same cultural group. Placing a child in an orphanage should only be a last resort.

► *Demobilizing child soldiers*—Child soldiers may find it particularly hard to emerge from war and build a new life. Many will have lost their families or have been forced to terrorize their own communities, making it impossible to return home. They may also find it difficult to live without the power that wielding a gun can bring, and will be tempted to drift into violence and crime. However, efforts are being made to demobilize child soldiers in a number of countries, including Liberia, Mozambique and

Rwanda. Some children are held first in transit camps to help them adjust to peace before returning to their communities and perhaps to school. Others are being offered training so they will have a more realistic chance of employment.

► *Healing the mental wounds*—Many child soldiers will have undergone horrific experiences that will live with them for the rest of their lives. For these, and many other children, one of the most important aspects of postwar development is psychological rebuilding.

Given the numbers of people affected, this task may seem daunting. But in recent years, much more has been learned about what can be achieved even with limited resources. In the past, treatment has concentrated on Western models using large numbers of highly paid staff to counsel individual children. While this may have helped a few children, it has proved far too slow and expensive a process to deal with the scale of the problem. It also has the drawback that Western advisers may know little about the local culture.

A better alternative is to train local people who can develop community-based approaches. Thus in Rwanda in 1994-1995, more than 2,000 Rwandese were trained as counsellors and caregivers. As a result of this work, around 70,000 people have participated so far in 'expression activities', such as singing, dancing, drama, drawing and writing, to ease the pain of their memories. Similarly in Bosnia and Herzegovina and Croatia, local professionals have been trained to screen children and identify symptoms of post-traumatic stress.

The long-drawn-out insurgency war in the Philippines has also been a traumatic experience for many children. There, it has been found that adults often avoid talking about violent incidents with their

UNICEF/PA. TOSTA/P/88

One of the most significant war traumas for children is separation from parents, and the primary concern must be to reunite children and families. After six months' separation, two children in Rwanda embrace their mother, who cries as she holds them.

children because they find it too painful. They also tend to underestimate the damage done to children. In this case, too, it has been found that children have to be encouraged to express their pain in the ways with which they are most comfortable—through art or drama or gentle conversation.⁶³

► *Restarting schools*—Another loss for children during wartime is the collapse of the education system. In Mozambique, damage to the education infrastructure left two thirds of the 2 million primary school age children without access to education.

A good way of returning children's lives to some semblance of structure and routine is to restart education as soon as possible. This does not require formal buildings or courses; education can be restarted even in refugee camps. In Rwanda, tens of thousands of children were able to start primary classes within two months of the end of hostilities through 'school in a box', a collection of basic supplies and materials for learning.

In Bosnia and Herzegovina and Croatia, international agencies have made great efforts to help local authorities reopen schools, even in the worst situations. In Sarajevo during the siege, individual dedicated teachers continued classes in their homes, in basements, or in other safe places, until schools were officially restarted in March 1993. In east Mostar, where there has been no electricity, children have been studying by candlelight with only the most basic materials.⁶⁴

Attending classes, in whatever surroundings, can help children start the process of recovery, healing and reconciliation. In addition to conventional school lessons, they can be taught simple survival techniques, the dangers of minefields, and conflict resolution.

In Liberia, readmission to local schools lies at the hub of a demobilization programme for child soldiers, which draws on community-based rehabilitation initiatives, vocational training centres, drop-in centres and halfway houses.

► *Education for peace*—When schools are functioning there is also the opportunity to make a longer-term contribution through 'education for peace'—allowing children to develop mutual understanding, to resolve differences without recourse to violence and to show how human diversity can be embraced rather than become the basis for barbaric behaviour.

In Lebanon in 1989, UNICEF negotiated with a number of armed factions to transport children from different religious and cultural backgrounds to a two-week summer camp. Through sports, creative workshops and other activities, the children were invited to question their values, beliefs and biases while learning conflict resolution skills. Since then, more than 240 NGOs have undertaken education for peace activities, and the Lebanese Government has included peace education in the national curriculum.

Education for peace has also been taken up in other countries. In Liberia, a Children's Peace Theatre has been touring since 1992, promoting unity and reconciliation. In Mozambique, a Peace Circus uses art, dance and theatre to demonstrate that differences do not have to be settled at the point of a gun.

Though the underlying purpose of all of these programmes is the same, they have to be developed by people in affected communities to match particular cultural needs and circumstances. Many of the same principles are also being applied in schools in a number of other countries to counter racism and animosity towards immigrants and to foster the value of tolerance.

UNICEF and NGOs work together to help child refugees—starting with vaccinations and checking children's weight-for-age. Growth monitoring is vital for detecting malnutrition, which, even when mild, threatens children's lives.

Anti-war Agenda

The plight of children in war-time contradicts not just every normal human concern for their welfare but also the professed beliefs and legal obligations of those responsible. It might be easy to dismiss this contradiction as callous hypocrisy. UNICEF sees it rather as a challenge. We believe that insisting on the rights of children is one of the best ways of reasserting core humanitarian values. In the words of Graça Machel, “Despite the inherent brutality of conflict, no one can possibly believe it is ever permissible to murder, rape, torture or enslave children.” Nor is it permissible to stand by and allow it to happen.

We do not argue that our Anti-war Agenda is some grandiose initiative to bring peace in our time. We do argue, however, that it is a vital beginning. And what gives it particular legitimacy is the existence of the Convention on the Rights of the Child.

The Convention is the guiding force of the Anti-war Agenda and we are determined that warring parties in any conflict be aware of, and be obliged to apply, the protections for children that the Convention provides. We will strive to ensure that the principles of international human rights law are observed to the full when the lives of children are at stake—whatever is needed, be it training of the military in various countries, training for UN peace-keepers or training for international NGOs.

UNICEF believes—along with many colleagues from governments, humanitarian agencies and NGOs—that the following agenda is vital:

Prevention

The world must no longer wait for the outbreak of hostilities before it pays heed. Much more deliberate effort should be made to address the underlying causes of violence and to invest more resources in mediation and conflict resolution.

Girls and women

In the midst of conflict, specific community-based measures are necessary to monitor the situation and needs of girls and women and especially to ensure their security because of the terrible threat they face of sexual violence and rape. Traumatized girls and women urgently need education and counselling. Because in times of conflict women’s economic burdens are greater, access to skills training, credit and other resources must be secured. Education, women’s rights legislation and actions to strengthen women’s decision-making roles in their families and communities are all needed, both before and after conflicts.

Child soldiers

UNICEF believes that the minimum age of recruitment into the military should be 18 years. At present, under the Convention on the Rights of the Child, it is 15 years. The change could be achieved through the adoption of an Optional Protocol to the Convention. Beyond that, there is a great need to concentrate on rehabilitating child soldiers to prevent them from drifting into a life of further violence, crime and hopelessness.

Land-mines

No international law specifically bans the production, use, stockpiling, sale and export of anti-personnel mines. It is now time for such a law. UNICEF joins many other organizations in concluding that this is the only way to stop the endless suffering of children and other civilians. UNICEF will not deal with companies manufacturing or selling land-mines.

War crimes

Recent years have seen the most barbaric acts of violence against children and other civilians. These must be denounced as they are revealed. International war crimes tribunals must have both the support and the resources to bring perpetrators to justice.

Children as zones of peace

This idea should be pursued more vigorously. The gains from establishing such zones may be fragile and temporary. Nevertheless, zones of peace have become an important part of international diplomacy—capable of prising open vital areas of humanitarian space in even the darkest conflicts. As such, UNICEF intends to pursue the possibility that zones of peace be raised to a tenet of international humanitarian law.

Sanctions

Economic sanctions are imposed on the assumption that the long-term benefits of pressure on errant regimes outweigh the immediate cost to children. This may not be the case. There should be a 'child impact assessment' at the point at which any set of sanctions is applied, and constant monitoring thereafter to gauge impact.

Emergency relief

In situations of long-term conflict, aid should be seen as part of a process to help rebuild a society's capacity and promote development.

Rehabilitation

A much more deliberate effort needs to be made to demobilize both adult and child soldiers and rebuild communities so as to offer not just respite but also reconciliation. An important part of rehabilitation must be to address the psychosocial damage that children suffer.

Education for peace

Disputes may be inevitable, but violence is not. To prevent continued cycles of conflict, education must seek to promote peace and tolerance, not fuel hatred and suspicion.

UNICEF is committed to mobilizing whatever resources are necessary in pursuit of these goals wherever conflicts break out. It is the singular characteristic of warfare in our time that children suffer most. But that only makes the task more urgent. Without minimizing the difficulty, we are confident that children's needs can be met even in the midst of the inferno of war. However dreadful the armed conflict, the death and suffering of children cannot be tolerated.

Children need be the victims of war only if there is no will to prevent it. Experiences in dozens of conflicts confirm that extraordinary actions have been taken and can be taken to protect and provide for children. Our Anti-war Agenda is intended to expand the scale and scope of those efforts, and we will direct much of UNICEF's future activities to this all-important end.

Fifty years for children

The creation of the United Nations in 1945 represented the coming of age of an ideal of international cooperation. Its immediate spur was the destruction caused by World War II, but behind this lay a longer-term desire to promote world peace. There was, however, no idea of setting up within the constellation of new institutions a special organization for children. The creation in 1946 of the United Nations International Children's Emergency Fund was an accident of early cold war politics.

The prospects in Europe were grim. The winter of 1946-1947 was particularly bitter. Millions of people were still without proper shelter, fuel, clothing or food. Children especially were suffering: in some affected areas, half of all babies were dying before their first birthday. The Allies, anticipating widespread devastation at the end of the war, had established the United Nations Relief and Rehabilitation Administration (UNRRA) in 1943 to provide general assistance. But the Iron Curtain descended, and the United States Government refused to go on using UNRRA as a relief channel because it was aiding countries in both Western and Eastern Europe.

Photo: Children of Greece. UNICEF was set up to meet the emergency needs of children when famine threatened parts of Europe in the aftermath of World War II.

Just as UNRRA was about to be wound up, however, voices were raised at its final meeting in Geneva to protest the fate of Europe's children. The delegate from Poland, Ludwik Rajchman, was particularly vocal, and the meeting accepted the proposal that UNRRA's residual resources should be put to work for children through a UN International Children's Emergency Fund—an 'ICEF'. Rajchman was regarded, therefore, as the founder of UNICEF. The Executive Director designate, Maurice Pate, made it a condition of his service that there were no caveats about where the aid (mostly dried milk) might go, insisting that UNICEF support equally children in vanquished as well as victorious countries. Subsequently, on 11 December 1946, a resolution of the UN General Assembly—number 57(1)—brought UNICEF into being. Fortuitously, therefore, the Children's Fund became part of that continuing experiment in international cooperation that has since constituted the United Nations system.

Coincidentally and almost unnoticed, the international community had also embraced the new central principle: that children were above the political divide.

This was quickly put to the test. Some of the most important early programmes supported by UNICEF were established in East European

The winter of 1946-1947 was particularly bitter. Millions of people were still without proper shelter, fuel, clothing or food. Children especially were suffering: in some areas, half of all babies were dying before their first birthday.

countries—Poland, Romania and Yugoslavia—as well as Germany. And in the late 1940s, UNICEF provided relief assistance on both sides of the civil wars in China and Greece. It also sent aid to children in the Middle East uprooted by the creation of Israel.

UNICEF was established to help children damaged by war. But it stayed in existence to take on a much broader role. While UN Member States had not intended to prolong UNICEF's life beyond the postwar emergency, they did include in its founding resolution the phrase "for child health purposes generally," and this was to offer the Children's Fund a permanent niche in the large-scale control and prevention of diseases affecting children.

When the time came in 1950 for the UN to close down its 'ICEF', a successful lobby was mounted to save it. This time, it was the new nations of the 'developing' world that spoke up. How, asked the delegate from Pakistan, could the task of international action for children be regarded as complete when so many millions of children in Africa, Asia and Latin America languished in sickness and hunger, not because of war, but because of the age-old problem of poverty? Again, the plea did not go unheard. This was the first turning-point in UNICEF's history. In 1953, the General Assembly confirmed the children's organization as a fixture in the UN system.

UNICEF at this time dropped 'International' and 'Emergency' from its title—becoming simply the United Nations Children's Fund (although retaining its acronym). But it never abandoned the children of crisis—those affected by war, conflict, drought, famine or any other emergency. However, its mission expanded as the post-colonial era presented it with a new challenge.

In the late 1950s and early 1960s, the winds of change were to blow away most of the remaining colonial order in Africa and the Caribbean. And at the United Nations, US President John F. Kennedy urged an end to the poverty in the newly independent countries of the developing world. UNICEF took up that challenge on behalf of children. This was the second major turning-point in UNICEF's history.

The 'development' era redefined the children's cause. Children previously had been seen as objects of purely humanitarian and welfarist concern—as 'children in distress' or as 'children in poverty'—to be taken into care or given supplementary support. Like refugees, the elderly or the disabled, children were regarded as a special group. But according to the new development perspective, children were not another cause. They were part of every cause. Among the hungry, the sick, the ill-fed, the poorly clothed, the homeless, the jobless, the illiterate and the destitute, there were always children. And unless they were orphaned or abandoned, children could never be treated in isolation from their parents and families, and especially not from their mothers.

From this perspective, a mission on behalf of children was no longer neat and self-contained. Helping nations to help their children demanded engagement in many areas of human activity. It certainly involved creating services to help children directly, such as maternal and child health, early childhood care and primary education. But it also demanded others that were not specific to children, such as water supplies and sanitation, slum and shanty town renewal, and credit facilities for women entrepreneurs.

The same breadth of concern also extended to policy. Any issue that affected whole communities also

From the beginning, UNICEF has helped feed hungry children wherever they are, supporting all children equally.

affected their children—agriculture, industrialization, population growth, women's rights, environmental depletion and urbanization. The list grew steadily—later including debt, structural adjustment and the post-cold war transition. And always present or waiting in the wings were the multiple predicaments of disaster and conflict.

The response to the problems of children thus evolved into a subset of the growing post-colonial 'science' of development, and the quest to eradicate poverty. Within this broader pursuit, however, UNICEF argued that children had to be singled out because they suffered the most acutely from poverty. As a result, they were also poverty's most sensitive barometer.

Down the years, the UNICEF response to children's needs underwent many changes. In the 1950s, it involved mass campaigns against the menace of epidemic disease: tuberculosis, yaws, trachoma, leprosy and malaria. In the 1960s, the development movement emphasized the miracles to be wrought by transferring capital and technology from rich countries to poor and by investing in human capital, including children—'our most precious resource'. In the 1970s, doubts about development experience grew more prominent, and disillusionment with the pursuit of economic growth led to a search for alternative approaches that were more people- and community-centred.

The 1980s brought further disappointments as the economies of many countries in Africa and Latin America went into precipitous decline and were forced into budgetary cuts and readjustment. Indeed, for many parts of the world the 1980s have been labelled a 'lost decade'—though in the case of children the 1980s can also legitimately be described as the decade in which their cause was re-found.

The rediscovery of children as a group in their own right was prompted from two directions simultaneously. The first was the child survival revolution, which was later expanded to child survival and development. In 1982, under the energetic leadership of Executive Director James P. Grant, UNICEF launched an initiative to reduce preventable child deaths from conditions such as diarrhoea and measles, which in the late 20th century ought not to be life-threatening. Indeed, some 15 million children under the age of five were still dying every year, two thirds of them from readily preventable causes. James Grant called this the "silent emergency" that deserved worldwide action. This initiative found an extraordinary degree of global resonance and helped reactivate the people-centred development agenda and increase its political appeal.

The high-water mark of the child survival and development revolution was the 1990 World Summit for Children, at the time the largest-ever gathering of Heads of State and Government—including 71 Presidents and Prime Ministers. In all, the representatives of 159 governments committed themselves to a joint Declaration and Plan of Action on behalf of the world's children. For the first time, the global community agreed upon international goals—at the highest political level—to reduce rates of mortality and disease, malnutrition and illiteracy, and to reach specific targets by the year 2000.

The second factor propelling forward the children's cause was a regenerated campaign for child rights. This campaign had its genesis during and after World War I, when the right of children to special protection was first internationally acknowledged. In 1924, the League of Nations had adopted a World Child Welfare Charter. And later, after

In 1946, UNICEF distributed blankets and other forms of relief to children like this one in Greece.

UNICEF/03118

SUB-SAHARAN AFRICA

- ▶ Progress for children in Africa has been slower and more uneven than in other regions.
- ▶ Risk of dying before age five is still higher than in any other region despite the decline in USMR from 25 per cent in 1960 to 18 per cent in 1993. In recent years, it appears to have increased in several countries, including Madagascar, Zambia and Zimbabwe.
- ▶ Life expectancy, which increased from 37 to 51 years between 1950 and 1990, remains the lowest in the world.
- ▶ In the early 1980s, only 20 per cent of children in the region were immunized; in the early 1990s, about half were.
- ▶ The number of children in primary school has quadrupled since 1960. The girls' enrolment ratio more than doubled from 18 to 46 per cent between 1960 and 1990. Nevertheless, only half of eligible children are enrolled in primary school, and the gender gap remains wide.
- ▶ During the 1980s, the enrolment rate decreased in about half the region's countries. No other region has ever experienced such a set-back.
- ▶ Malnutrition has not declined, and one third of children suffer from stunting.
- ▶ On average, the number of children per mother has barely declined in 40 years: it is still more than 6, the highest of all regions.

World War II, non-governmental organizations (NGOs) lobbied the newly formed United Nations to endorse this document. As a result, in 1959, the UN General Assembly passed a new version of the Child Welfare Charter in the form of a Declaration of the Rights of the Child.

During the following two decades, however, the cause of children was progressively drowned out by the noise from so many others—the environment, for example, and world hunger. Accordingly, in an effort to bring children back to the public's attention, the NGO children's lobby pressed the UN to declare 1979 the International Year of the Child (IYC).

Rather than presenting development as the main context for addressing children's needs, IYC focused instead simply on the child. This was not a reversion to the previous welfarist approach since it involved airing many difficult issues in uncompromising terms that went beyond welfare and philanthropy—taking the wraps off such sensitive subjects as child labour, child abuse and child prostitution. IYC was also to pave the way for a major new advance for child rights—the replacement of the 1959 Declaration of the Rights of the Child with a more weighty international legal instrument.

In 1989, the UN General Assembly passed the Convention on the Rights of the Child. This entered into force in the following year, and as with the child survival and development revolution, it touched a highly responsive chord, and faced fewer obstacles to ratification than most other human rights instruments.

The year 1990 was, therefore, a watershed for children. The World Summit and the passage into international law of the Convention on the Rights of the Child were crowning moments of twin campaigns: for children at the leading edge of hu-

man development, and for children at the cutting edge of human rights.

These campaigns may have crystallized during the 1980s, but their expansion belongs to the whole course of the post-World War II and post-colonial period. In the decade of the 1990s, these campaigns have converged and begun to take on each other's colouring and perspective.

In the uncertainties of the post-cold war era, the outstanding question for UNICEF and other champions of the children's cause is whether the momentum for children will continue to grow. Amid the clamour generated by such issues as environmental sustainability, gender equality, debt forgiveness and ethnic self-determination, children may turn out to be just another concern whose moment in the sun is swiftly eclipsed. Alternatively, the new priority for 'child survival and development' and 'child rights' may actually echo a profound shift of human values and behaviour.

The following historical review commemorates UNICEF's 50th anniversary year and traces decade by decade how the cause of children internationally has evolved over the past 50 years. It explores the contribution of UNICEF against the backcloth of changing ideas in social and economic affairs, and tries to see where the children's cause is headed for the year 2000 and beyond.

The 1950s: Era of the mass disease campaign

The inclusion in UNICEF's founding resolution of the phrase "for child health purposes generally" opened the way for UNICEF to become a permanent fixture in the UN system. And it also paved the way for UNICEF involvement not only in child feeding but in public health.

During World War II and its

aftermath, disease rates had soared among weakened populations. In particular, forms of tuberculosis—the ‘white plague’—had reached epidemic proportions. In Poland, for example, the child death rate from TB had multiplied four times during the war.

As a result, in 1947 the Scandinavian Red Cross societies sought assistance from UNICEF for an international tuberculosis campaign that aimed to immunize all uninfected European children. This was to be both the largest vaccination campaign ever undertaken and also the first one to use the BCG vaccine outside the controlled circumstances of the clinic.

There were some qualms that UNICEF would be treading on the territory of the fledgling World Health Organization (WHO), but it was argued that UNICEF would complement WHO’s technical advisory role since it could offer material support in terms of vaccines, syringes and vehicles.

The international TB campaign set the tone for UNICEF’s involvement in health care beyond emergency child feeding. Indeed, as the 1940s gave way to the 1950s, the predominant motif in international public health campaigns generally was the struggle to control or eradicate epidemic disease. These campaigns were among the first, and certainly the most spectacular, extensions of non-war-related international assistance. And they moved far beyond Europe, to Africa, Asia and Latin America. They also changed UNICEF’s priorities—extending its programme geographically to countries in the Middle East, the Indian subcontinent and the Far East, as well as shifting its focus from emergency first aid for children to long-term preventive health care.

This attack on ill health was prompted both by demand and

supply. The demand came from the heavy case-load of infectious disease to be found among populations in the poverty-stricken ‘underdeveloped’ world. The supply came from the breakthroughs in medical technology of the previous half-century. New drugs and vaccines were becoming ever cheaper and, for the first time in history, offered a genuine prospect that age-old scourges could be swept away without waiting for the spread of doctors, hospitals and health centres. Used on a mass scale, and following a systematic geographical plan and timetable, the new techniques could—theoretically—force a specific disease to relinquish its hold over a whole population.

The disease that succumbed earliest and most dramatically to the mass campaign was yaws. This painful condition, spread by a micro-organism, could lead to total disability. It was found in tropical, poor and remote rural areas and was contracted through broken skin. In the early 1950s, there were thought to be around 20 million cases worldwide, over half of which were in Asia. The invention of penicillin transformed the prospects of cure. One shot cleared the ugly pink lesions, and a few more cleared the disease from the body.

The campaign against yaws with which UNICEF was most closely involved was in Indonesia. Mobile teams of lay health workers located the cases, and health professionals treated them. By 1955, these teams were treating over 100,000 yaws cases a month. Similarly in Thailand, nearly 1 million cases had been cured, and full eradication in Asia was becoming a distinct possibility.

The almost miraculous effect of the yaws cure also acted as a spur to other campaigns. One was tuberculosis: by the mid-1950s, 3.5 million children worldwide were being

As drugs and vaccines became cheaper in the 1950s, international public health campaigns began to focus on controlling epidemic disease through immunization.

CFR-32581/Long

Indonesia mounted the world's largest campaign against yaws—curable through penicillin—in the 1950s, employing large numbers of mobile male nurses working in the field.

tested for TB every month and over 1 million vaccinated. Trachoma too was under attack. This eye infection, which then affected up to 400 million people worldwide, was treated on a mass scale with an antibiotic ointment. Malaria was another priority. At the mid-point of the century, this disease had the highest incidence in the world—200 million victims annually. The malarial frontier was rolled back by DDT spraying of people's homes.

Finally, leprosy sufferers could be offered a reprieve. As the first effective treatments for this stigmatizing condition came into use, they too were incorporated into the disease campaign machinery.

This enthusiasm for dealing with disease through technical interventions even extended to malnutrition. When in the early 1950s investigations among children on the African continent revealed widespread malnutrition, international public health experts were so attuned to the heroics of disease conquest that they behaved as if malnutrition, too, was an epidemic infection. They gave it medical labels—kwashiorkor and marasmus—and the medicine they prescribed was protein.

One of the most convenient forms of protein was milk. The alchemy that this particular blend of animal fat and protein could perform on child health was almost as sacrosanct a principle of nurture as motherhood. UNICEF was still heavily engaged with child feeding, and for the first two decades of its existence the heart of its efforts on behalf of child nutrition was the provision of milk.

This was greatly assisted by a reliable supply. In the early 1950s, the US had accumulated a vast reservoir of skim milk which, due to advances in dairy production, could be dried, preserved and later reconstituted. In 1954, the US Congress passed Public Law 480, through

which the US offered aid organizations surplus farm produce free of charge. UNICEF was an important recipient; in 1957, it used this as part of its programme to provide milk via schools and health facilities to 4.5 million children and to pregnant and nursing mothers. In some countries, UNICEF also supported tropical dairying. In time, however, it was to replace milk-based interventions with sustainable solutions such as home-grown vegetables, fruits and poultry.

The mass disease campaigns certainly succeeded in reducing the levels of infection for both children and adults: in Ceylon, for example, between 1945 and 1960 the death rate from malaria dropped from 1,300 per million to zero. In fact, so successful were the campaigns that during the next decade they were blamed for igniting a population explosion. But, as experience was beginning to show, not everything about the campaigns was quite as perfect as their public image suggested.

The campaigns had been conceived as interim solutions—a means of holding some forms of ill health at bay until such time as regular health services could be set up. However, it was precisely this lack of a health support network that made the operation very difficult and expensive to mount and sustain. In places where trained health professionals were few, administration weak, communications poor and transport intermittent, the sharp and decisive stroke the disease campaign was meant to deliver could dissolve into a long, repetitive and inconclusive enterprise.

The campaign managers had underestimated the operational difficulties and the human complexities. In the 1950s and 1960s, contemporary adulation for technology and the 'quick fix' encouraged the enthusiasts of international public

health to believe that, with enough resources, better epidemiological surveillance and extra strategic refinements, they would finally reach their goal. Like their counterparts in other disciplines, the public health specialists were new to the challenges of development. They were bound to make mistakes.

For diseases like yaws, when people found painful sores disappearing as if by magic, they were happy to cooperate. And there were other notable successes, of which the greatest was the eventual eradication of smallpox. But for other diseases, people could not always see the cure work so directly and were therefore less likely to change their behaviour. One of the most difficult challenges was malaria.

The massive malaria campaign launched in 1955 by WHO and UNICEF finally failed because its chief architects misjudged the willingness of both humans and malarial mosquitoes to live, eat, sleep and generally behave according to technical assumptions. Eventually, the malaria warriors were forced to accept that without a basic service to back up and consolidate their gains, it was almost impossible to 'impose' health on a population unless it was geographically circumscribed—as, for example, in a relief camp.

The most important lesson to be learned from the programmes of the 1950s was that the people of Africa, Asia and Latin America were not a blank sheet of paper on which experts from the industrialized world could write their own version of progress. However, another decade at least was to pass before this lesson was fully absorbed.

The 1960s: Decade of development

In January 1961, the United Nations resolved that the decade of the 1960s would be the Decade of

Development. President Kennedy launched the Decade at the UN in New York. Earlier, in his inaugural address as President, he had signalled a new sense of purpose in international affairs. He declared: "To those peoples in the huts and villages of half the globe struggling to break the bonds of mass misery, we pledge our best efforts to help them help themselves."

The rapidly decolonizing world thus embarked on a new age of partnership. In this view, to have one part of humanity live well while the other lived in penury was morally unacceptable. But there were also strategic considerations. In the ideological confrontation between East and West, the promise of poverty alleviation was a weapon to be deployed in the building of alliances.

As new countries rushed to freedom—no fewer than 17 former colonies in Africa achieved independence in 1960—the climate was one of excitement and hope. The new links being forged within the community of nations seemed to open up a new era of international peace and prosperity. The countries of the 'third world', having cast off their colonial status, now also needed to cast off their poverty. But for this they needed aid in the form of funds and know-how from their richer neighbours. Thus was born the push for development, a concept which along with more conventional notions of economic investment also embraced a degree of moral and humanitarian fervour.

During the late 1950s, the United Nations had begun to adapt its institutions to take on the development challenge. It already had technical expertise within its specialized agencies but it also needed a mechanism to channel financial resources. In 1957, therefore, it established a Special Fund to support the growth of infrastructure and industrialization. This was later to

MIDDLE EAST AND NORTH AFRICA

- ▶ This region has reduced child mortality faster than any other in the developing world. In 1960, one quarter of all children died before age five; by 1993, U5MR had been cut to 7 per cent. Nevertheless, the survival prospects of children are lower than those in regions where income is comparable.
- ▶ Immunization campaigns doubled coverage against the six main vaccine-preventable diseases, from 42 per cent in the early 1980s to 84 per cent a decade later. Iran, Jordan, Kuwait, Oman and Tunisia now report immunization rates of over 95 per cent.
- ▶ Total enrolment in primary schools more than doubled between 1970 and 1990. The girls' enrolment rate of 28 per cent in 1960 had soared by 1990 to 70 per cent.
- ▶ The female literacy rate more than doubled between 1970 and 1990. But two thirds of the region's estimated 65 million illiterate adults are women.
- ▶ Children fare differently depending on country of origin, residence and gender. The Sudan and Yemen have much higher child mortality rates than Kuwait and the United Arab Emirates. In Egypt and Tunisia, rural children are twice as likely to be malnourished as those in urban areas.

SOUTH ASIA

- ▶ One quarter of all the children in the world live in South Asia. In spite of lingering poverty, their survival prospects have improved considerably over the past three decades: in 1960, 1 in 4 children died by age five; by 1993, the number was 1 in 8.
- ▶ Life expectancy at birth rose from 39 to 60 years between 1950 and 1990, but women do not significantly outlive men, as they do in all other regions.
- ▶ The girls' net primary school enrolment ratio increased from 29 per cent in 1960 to 62 per cent in 1990. But the gender gap in education remains wide; a girl is 20 per cent less likely to attend primary school than a boy. Child labour is a major obstacle to education.
- ▶ By the early 1980s, 28 per cent of children were immunized against vaccine-preventable diseases; by the early 1990s, the immunization rate had almost tripled to 85 per cent. In Bangladesh, coverage soared from 1 to 74 per cent during the 1980s.
- ▶ Strong disparities persist. A child born in Sri Lanka can expect to live 72 years, one born in Bhutan 50 years.
- ▶ Malnutrition affects 60 per cent of children, by far the highest rate of any region.

be transformed into the United Nations Development Programme (UNDP).

At first blush, UNICEF with its modest humanitarian programme did not appear to belong to the new 'development' club. But no organization in the UN community could remain immune to the new currents of thinking. During the early 1960s, UNICEF tried to absorb the torrent of ideas and chart its own path within them. This quest was essentially guided by Dick Heyward, UNICEF's senior Deputy Executive Director and intellectual powerhouse from 1949 to 1981. In the process, UNICEF underwent the third important transformation in its history.

The turning-point was a special survey into the needs of children. This survey, initiated by UNICEF in 1960, took a year to complete, and was accompanied by 'state of the art' reports from the specialized agencies. These included: WHO, for the health needs of children; the Food and Agriculture Organization (FAO) and WHO, for the nutritional needs of children; the United Nations Educational, Scientific and Cultural Organization (UNESCO), for the educational needs of children; the UN Bureau of Social Affairs, for the social welfare needs of children; and the International Labour Organisation (ILO), for the work and livelihood needs of children. The final report, *Children of the Developing Countries*, represented a watershed in nations' outlook on how to help their most vulnerable citizens.

The report interwove social and economic strands concerning children's well-being in a fresh and innovative way and presented a theory of development that underlined the importance of satisfying human needs during various phases of childhood and pre-adulthood. In particular, it argued that children's

needs should be built into national development plans. Children should not be treated as if they were the orphans of the development process or merely its accidental baggage; they should be a focus of all policies directed at building up a country's 'human capital'. Just as over the course of the 20th century, the motto 'children first' had gained currency during times of war and sudden catastrophe, so a new version of the same motto had been articulated in the context of development.

This had major implications for the programmes UNICEF supported. They could no longer be confined to those run by sub-departments of Ministries of Health and Social Welfare. If children were a country's most precious resource, then their interests were not merely something to be addressed at times of distress. Rather, their well-being should be a specific target of investment and indeed of the whole development effort. The situation of children would have to be discussed within Ministries of National Planning, no less. And because children's concerns would have to be contemplated by research institutes and within national surveying and planning exercises, these were all activities that UNICEF would henceforth be willing to support. The importance UNICEF attached to 'planning for children' was confirmed in its special 1962 declaration of policy for the Development Decade, endorsed that year by the UN General Assembly.

The other major change was to abandon the compartmentalization of children's needs. In the future, UNICEF would consider the needs of children along with those of their parents and nurturers, and would take into account the 'whole' child. Instead of treating the child as a set of parts of which the only ones of concern were those related to

physical well-being, UNICEF should be willing to address the child's broader intellectual and psychosocial needs. The immediate outcome was a change of policy whereby UNICEF for the first time—and to the satisfaction of the countries of the developing world—was willing to provide funds for formal and non-formal education.

Like many other members of the international humanitarian community, UNICEF set out over the next few years to show that the fields in which it was engaged lay at the heart of development. These were traditional arenas such as food and nutrition, and maternal and child health care. But they also included new ones such as education, women's issues, water supplies and sanitation. In these areas, UNICEF could provide material assistance in the form of equipment, drugs, vehicles and training stipends. In very poor environments, technical advice was futile without the wherewithal to put it into effect.

Because the humanitarian organizations were essentially field oriented, they learned this lesson faster than most. Other agencies focusing more on economic development had been relying largely on the formula of technical advice and cheap credit. This was a woefully inadequate response to poverty and its complex web of political, social, cultural and economic dimensions.

The humanitarian agencies, on the other hand, wanted ordinary families to receive tangible benefits. They were not interested in theoretical models derived from Western norms, only in trying to make things happen on the ground. Their vision of development was one in which pride of place went to the needs of the poor—and in the case of UNICEF, the needs of poor children.

But by the middle years of the decade one further consideration was looming over the horizon. The

demographers had discovered that recent declines in the death rate unaccompanied by matching declines in the birth rate were playing havoc with developing countries' population profiles. The kind of increase that had taken three centuries to happen in Europe was taking place in parts of Africa, Asia and Latin America within 50 to 75 years.

The resulting 'population explosion' threatened to undermine all the hard-won gains of human progress and subject the planet's non-renewable resources to overwhelming strain. It quickly became an international *cause célèbre* that all agents of development were forced to address. The technological instrument was readily available—artificial contraception.

But at a meeting in Addis Ababa in 1966, the UNICEF Executive Board opted for the concept of 'responsible parenthood', whose primary objective was to improve the survival, well-being and quality of life of the child, the mother and the family. It did not mean that family planning was eschewed; it simply meant that family planning was seen in the broader context of maternal and child health, embracing improvements in the status of women (a harbinger of the conferences in Cairo and Beijing), promoting literacy, raising the age of marriage and avoiding unwanted pregnancies.

In 1965, UNICEF was awarded the Nobel Peace Prize. Earlier that year, Maurice Pate, who had led the organization since its inception, died. His place as Executive Director was taken by Henry Labouisse. Under his careful statesmanship the UN's organization for children became gradually more prominent in the issues of the day. Even so, it was not until 1972 that the UN formally recognized that UNICEF was a development, rather than a welfare, organization and began to review its

Training a country's traditional birth attendants in pre- and postnatal care and safe delivery techniques was a strategy to reduce maternal mortality rates and protect newborns.

Village water supplies

In the summer of 1967, a chronic drought and an alarming drop in India's underground water reserves ignited a revolution in village water supplies—and started a process of improvement whose effects are felt to this day throughout Africa, Asia and Latin America.

Around 70 per cent of India is separated from the water table by a deep rock shield, and many Indian villages that rely on underground water are extremely vulnerable to drought. In the 1950s, the Indian Government had identified 153,000 villages as 'water-scarce'—most of them in hard-rock areas.

In the 1960s, there was a series of droughts, and in the summer of 1967 the situation became critical in Bihar and Uttar Pradesh when many of the existing wells dried up. It would have taken many weeks for the villagers to sink more wells using traditional methods, and some 250 villages were faced with evacuation to refugee camps. UNICEF flew in 11 pneumatic drilling rigs capable of boring through 150 feet of rock in about eight

hours. When this emergency had passed, the rigs were transferred for use in drought emergencies elsewhere.

As the water table continued to recede, the Government asked UNICEF for more drilling equipment. Between 1970 and 1974, UNICEF shipped in 125 hammer rigs, along with trucks and spare parts. Each of these rigs could drill about 100 boreholes a year—theoretically supplying water to 12,000 villages and about 9 million people.

But boreholes also need efficient pumps. Most of the handpumps in India at that time were poor-quality cast-iron replicas of European and American models that had usually been designed for family use. But while pumps in the US might have been used by a farming family three or four times a day, those in India were used incessantly, with women and children queuing up to use each pump from dawn till dusk. Not surprisingly, the pumps frequently broke down. When UNICEF did a survey of boreholes and pumps in two states, it found that 75 per

cent of the pumps were out of action.

Clearly, India needed a more rugged pump. A 1975 workshop sponsored by UNICEF, the World Health Organization (WHO), the Government of India and the government of Karnataka state summed it up: a design simple enough to be manufactured in unsophisticated workshops, easy to maintain and costing no more than US\$200.

Rather than start from scratch, however, UNICEF water supply staff searched for the most durable pump then available. They settled on the Sholapur pump that had originally been designed by a self-taught Indian mechanic. They modified this for easier mass production and maintenance, renamed it the India Mark II and field-tested it in 1976 and 1977.

Mass production of the India Mark II started in 1977-1978, with 600 units a month. By 1984, 36 manufacturers were producing 100,000 pumps a year. By 1987, annual production had reached 200,000. With exports to other countries in Asia, as well as to Africa and Latin America, the India Mark II was well on its way to becoming the best-known deep-well handpump in the world. Meanwhile, development has continued—and has produced the more user-friendly India Mark III.

In less than two decades, more than 1 million of the pumps have been produced, and they have proved both reliable and durable. A 1984 survey, commissioned by UNICEF, found that in six states in India, 80 per cent were operational at any one time. Every year about 50,000 new pumps are installed in India, and an equal number are finding their way into communities throughout the developing world.

Photo: Safe water, a primary requisite for health, is also a delight.

work under its economic and social, rather than humanitarian, machinery. And it was not until later still that the idea of investing in children would move away from the notion of philanthropy and into the development mainstream.

The 1970s: Era of alternatives

By the early 1970s, the development movement was running out of steam. The idea that transfers of capital and technical know-how would quickly dispense with gross poverty had proved misconceived. During the previous decade, many developing countries had achieved high rates of economic growth—increases of 5 per cent or more in GNP—but little of this had ‘trickled down’ to the poor. On the contrary, their numbers had swollen—as had the gap between rich and poor people, and between rich and poor nations. The rates of population growth were partly to blame; but equally important were policies based on simplistic assumptions. This much had become clearer to the growing community of development analysts attached to universities, governments and international organizations. They busily began to diagnose what had gone wrong and set out on the quest for alternatives.

This led to a new climate of development thinking. Since economic growth did not automatically sweep poverty away, development analysts decided that the second Development Decade must also include measures deliberately targeted at the poor—to help them meet their basic needs for food, water, housing, health and education.

In the past, economists and planners had looked upon these rather as forms of ‘consumption’ unconnected to economic productivity. Now their thinking began to change. In 1972, Robert McNamara, then

President of the World Bank, made what was seen as a landmark statement. Governments in developing countries, he said, should redesign their policies so as to meet the needs of the poorest 40 per cent of their people—and relieve their poverty directly. The cornerstone of the new development strategy was thus an explicit attack on poverty—albeit one so mounted as not to damage economic prospects. Its economic slogans were: ‘redistribution with growth’, and ‘meeting basic needs’.

As policy makers began to focus less on economies and more on people, they realized that those bit-players, the humanitarians, had actually met the new criteria for success rather well. While the economic planners had focused on dams and factories, the humanitarians had focused on the village, the community, the family and the individual. They appeared to be putting into effect British economist E. F. Schumacher’s concept that ‘small is beautiful’—a proposition that seemed to encapsulate the spirit of the era. NGOs, with their localized mini-projects, already enjoyed an intimate relationship with the poor; UNICEF had similar advantages. Although it worked at one stage removed, its connections with communities were certainly much closer than those of any other player in the UN hierarchy. Within the development club, the programmes supported by the humanitarians, including UNICEF, began to enjoy a new legitimacy.

The early 1970s saw two events of particular significance for international development. One was the OPEC oil shock, which sent prices soaring and ended the era of cheap energy and cheap industrialization—and therefore of cheap development. The other was the global food shortage brought about by two disastrous world harvests in 1972 and 1974. The UN responded to the

Fig. 6 Rising debt

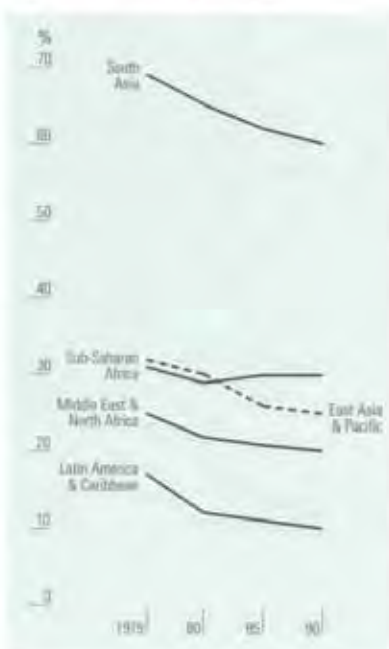

Total debt as a percentage of GNP increased in all regions over the period 1971-1993. Latin America's high debt levels of the 1980s have since fallen. Sub-Saharan Africa's debt, which has continued to soar, now surpasses its GNP.

atmosphere of crisis with a series of international conferences: on environment (Stockholm, 1972); population (Bucharest, 1974); food (Rome, 1974); women (Mexico City, 1975); human settlements (Vancouver, 1976); employment (Geneva, 1976); water (Mar del Plata, 1977); and desertification (Nairobi, 1977). Meanwhile, the countries of the developing world were growing in confidence. Encouraged by the success of the OPEC cartel in 1974, they demanded a new international economic order: a change in relationships among the nations to allow the up-and-coming members of the international community to gain access to world trade and financial markets.

These events and the currents of thinking they unleashed had important repercussions in UNICEF. The oil price hike also meant higher prices for fertilizers and all the equipment needed to increase agricultural production. And the world food shortage had serious implications for the health and well-being of the 500 million children who lived in the countries designated 'most seriously affected'. In 1974, the UNICEF Executive Board made a formal declaration of an 'Emergency for Children'. It was believed that even before the crisis struck, some 10 million children worldwide suffered severe dietary shortage. As the price of food continued to rise, child hunger and malnutrition were bound to increase.

At the prompting of Henry Labouisse and his deputy, Dick Heyward, UNICEF was also urgently considering what kind of programme strategy would reach children more cost-effectively. In 1975, the UNICEF Executive Board reviewed the findings of two important studies: one into the priorities for child nutrition in the developing world and another, conducted with

WHO, into 'alternative methods of meeting basic health needs'. From their conclusions, together with those of an earlier study into education, UNICEF's own version of the alternative order was rapidly emerging. It was to be known as the 'basic services' approach.

According to UNICEF, development was failing to reach large segments of the poor because existing services for health, education and agricultural extension were modelled along industrialized-country lines. If the poor had to wait for their lives to be improved by such services, they would probably wait forever. Existing services rarely reached as far as the village, and even when they did they were usually unconnected to each other. Worse, they were often unconnected to the villagers' own perception of their needs. As an alternative, UNICEF proposed a range of integrated basic services that would be flexible enough to be adapted by and within the community.

These basic services would also be community dependent. This approach was borrowed from the increasing number of community-based programmes in countries as far apart as Guatemala, Indonesia and Tanzania, which had incorporated a spirit of volunteerism along with traditional systems of mutual self-help. UNICEF had taken advantage of this by training and motivating lay members of the community to perform simple tasks such as baby weighing, early childhood stimulation and basic handpump maintenance. These volunteers could thus act as 'barefoot' workers delivering local services. The relatively few highly trained professionals who up to then had been performing routine activities were freed instead to supervise the cadres of volunteers. In this way, services could be more widely extended without exorbitant extra costs.

Community-based health care: Indonesia sets the pace

UNICEF/RESEA/Watson

In 1973, a nutrition survey found that more than two thirds of Indonesia's 20 million children under five years old were undernourished. UNICEF and the National Planning Board had been discussing possible responses with various government agencies, including the Ministry of Health and the National Family Planning Board (BKKBN).

BKKBN had promised villagers that if they achieved government targets for contraceptive use they would be rewarded with better social services. The problem was that the contraceptive use was rising but the new services were nowhere in sight—and a serious public relations problem was brewing in 500 villages. So BKKBN, the Ministry of Health and UNICEF initiated what was to become one of the pioneering community-based health programmes of the 1970s.

UNICEF agreed to provide a nutritional first-aid package for each village; the Ministry of Health and BKKBN ensured that the programme functioned at the village level. The agreed package included

weighing scales and charts so that mothers could monitor their babies' growth; oral rehydration salts to manage diarrhoea; vitamin A and iron supplements; and immunization through health centres.

This programme became very popular. Mothers built social activities around the monthly weighings for their babies. The 'weighing post'—a room borrowed for the purpose, or a shelter erected from village funds—gradually became an established community fixture. UNICEF was soon asked to provide kits for an additional 1,500 villages. The Government also gave strong financial support. President Suharto established a national nutrition board and a special Treasury account to support village nutrition.

During Indonesia's third Five-Year Plan (1979-1984), monthly weighing and nutrition education activities expanded to 80,000 weighing posts located in 41,000 villages.

Other government departments also played a part. The Ministry of Agriculture sent workers to meetings to advise

villagers on home gardening and livestock raising. The Religious Affairs Ministry reinforced health, nutrition and responsible parenthood messages with Islamic scriptures; religious leaders were offered materials to help them develop relevant sermons and talks.

In 1989, a study found that between 80 and 98 per cent of mothers brought their infants to village meetings. And by 1991, Indonesia had over 20 million children enrolled at 250,000 posts nationwide. Start-up costs for new posts ranged between US\$2 and US\$4 for each child, with recurring annual costs of around US\$0.75 per child.

Today, about 1 million village volunteers sustain a nationwide network of village health posts. These are supervised by 20,000 health workers from 5,000 health centres. Around 90 per cent of Indonesian families live within easy reach of primary health care. This has contributed to an impressive improvement in health standards. By the end of 1990, immunization coverage against major diseases was more than 80 per cent. Between 1974 and 1989, deaths from diarrhoeal dehydration fell from about 400,000 to 58,000. And between 1960 and 1993, infant mortality per 1,000 live births fell from 127 to 71.

In the 20-year period of the village nutrition programme, malnutrition has been halved. In the same period, Indonesia has made great strides in reducing poverty, an effort that undoubtedly contributed to improving nutrition. A recent evaluation of the village programme concluded that it is likely that half the improvement in nutritional levels is due to the village nutrition programme—a remarkable achievement.

Fig. 8 Demographic trends: Total births, under-16 population, fertility rate and life expectancy

The total fertility rate (average number of births per woman) in sub-Saharan Africa has recently started to fall, which should stabilize the number of births in the future. All other regions show large reductions in their fertility rates. In East Asia and the Pacific, the 1995 fertility rate is little more than a third of the 1950 level.

Births are projected to level off in all regions by the year 2000, except for sub-Saharan Africa, where the continuing increase in population will result in the annual number of births reaching 35 million by 2025.

In 1975, the under-16 population of the East Asia and Pacific region topped 500 million, and stabilized at that level. South Asia is projected to reach that level by the year 2000, and sub-Saharan Africa by 2025.

Life expectancy increased by 10 years or more in most regions between 1950 and 1995, with South Asia and East Asia and the Pacific showing gains of 20 years or more.

Source for four figures: United Nations, World population prospects - the 1994 revision, New York, 1995

In 1976, the UNICEF Executive Board committed itself to the basic services approach. By this time, UNICEF and WHO were already well on the way to agreeing on an alternative approach to health care. They had seen that health care structures in developing countries had evolved mainly into pale facsimiles of the high-tech delivery systems familiar in the industrialized world. Given the lack of resources, this had distorted priorities and led to a disregard of the basic principles of public health. Up to 90 per cent of a developing country's health budget could be absorbed by a handful of city hospitals serving the élite, while out in the countryside villagers were obliged to walk miles to the most rudimentary dispensary. The poor might occasionally receive visits from mobile teams of smallpox eradicators or water engineers, but services they urgently needed—notably those for maternal and child health—were rarely available.

At a time when heart transplants and *in vitro* fertilization were stunning the world, millions of people—up to three quarters of the population in many countries—remained beyond the reach of modern health care. Moreover, the sicknesses that afflicted them, or more usually their children, were simple and obvious. The poor were suffering and dying from diarrhoea, fevers and respiratory infections that no longer constituted a threat in the industrialized world and indeed were viewed there in the most pedestrian terms. They were the diseases of poverty. And they were disrupting, and in some cases destroying, the lives of hundreds of millions of children and families.

In 1978, at an international conference in Alma Ata in the then USSR, Ministers of Health from all over the developing world agreed that their health delivery systems

must be radically restructured to provide 'primary health care' (PHC) for all their citizens. The critical service was care for mothers and children before, during and after birth. Added to this were emergency first aid, surveillance of young child growth, disease control, family planning, safe water supplies and environmental sanitation. As with basic services, ordinary people would be enlisted in their own preventive care. This radical vision set an ambitious goal, 'Health for All by the Year 2000'.

During the first two Development Decades, UNICEF had argued that working for children was part of a much larger social and economic movement. But this emphasis on development and on other great issues of the day had a drawback. It meant that, even within the humanitarian community, the special needs of childhood and of disadvantaged child groups were in danger of being submerged. Anxious to project children back into the limelight, the Geneva-based International Union for Child Welfare and other child-related NGOs managed to persuade the UN to declare 1979 the International Year of the Child. Initially reluctant to commit its energies to a celebratory and possibly superficial affair, UNICEF was eventually persuaded to play a leading role. IYC proved far from superficial. It was a remarkable success. The children's cause had reached another turning-point.

The 1980s: Campaign for child survival

As the 1980s—the third Development Decade—dawned, the countries of the developing world were beginning to feel the chill of global recession. In the industrialized countries, growth had slumped and unemployment had risen to levels higher than at any time since the

EAST ASIA AND THE PACIFIC

- ▶ A rapidly rising income level, which outpaced all the other regions, has contributed to a dramatic improvement in educational and health conditions for children: U5MR declined from 20 per cent in 1960 to 5 per cent in 1993.
- ▶ Life expectancy has increased from 41 to 67 years over the last 50 years.
- ▶ Mothers on average had 6 children in 1950; today the average is 2.
- ▶ Since the early 1980s, the percentage of children immunized against vaccine-preventable diseases has increased from 20 to 90. China, the Republic of Korea and Viet Nam have achieved almost universal coverage. However, countries such as Cambodia and the Lao People's Democratic Republic report immunization rates of less than 40 per cent.
- ▶ The net primary school enrolment ratio has increased from 50 to 86 per cent between 1960 and 1990. The gender gap has been virtually closed. Three decades ago, a girl had only a 44 per cent chance of enrolment; by 1990, her chances had nearly doubled to 84 per cent.
- ▶ Progress against malnutrition has been modest. In 1990, one quarter of children suffered from stunting, compared to one third in 1975.

ORS: The medical advance of the century

UNICEF/588/Glammyre

During the 1980s, UNICEF launched the 'child survival and development revolution', concentrating its efforts on four potent methods of saving children's lives—growth monitoring, breastfeeding, immunization, and the use of oral rehydration salts (ORS)—the best way of combating the dehydration caused by diarrhoea.

The British medical journal *The Lancet* has described ORS as "potentially the most important medical advance of this century."

In the late 1970s, acute diarrhoea was killing around 5 million children each year. The obvious response to dehydration—giving the child water to drink—did not work because the liquid rushed through the digestive tract too quickly to be absorbed by the body tissues. The only answer seemed to be to bypass the digestive system altogether and rehydrate the body using an intravenous drip. This is an invasive and traumatic procedure for a child. And because it must be administered by someone with medical training, it is

completely impractical for most episodes of childhood diarrhoea, which take place out of range of any kind of medical attention.

In 1968, researchers in Bangladesh and India discovered that adding glucose to water and salt in the right proportions enabled the liquid to be absorbed through the intestinal wall. So anyone suffering from diarrhoea could replace the lost fluids and salts simply by drinking this solution.

One of the first large-scale field applications of oral rehydration salts took place in 1971 during the Bangladesh war of independence when outbreaks of cholera swept through refugee camps. Of the 3,700 victims treated with ORS, over 96 per cent survived.

Home-made versions of ORS are not difficult to make and can help prevent diarrhoeal dehydration. The Bangladesh Rural Advancement Committee (BRAC), for example, has shown mothers in Bangladesh how to mix water, salt and molasses to prevent dehydration when a

child falls ill with diarrhoea. Families can also use the rice water from the cooking pot to prevent dehydration. ORS, however, is best to treat dehydration when it occurs, as well as to prevent it.

ORS sachets are now being produced, with UNICEF support, in 60 developing countries. Total production is around 500 million sachets a year—costing around 10 cents (US) each.

Around half of all diarrhoea cases in the world's poorest countries are now treated with oral rehydration therapy (ORT), which means that ORS as well as recommended home fluids are given. This is a vast improvement over the 1 per cent level of usage at the beginning of the 1980s. But there is still an urgent need to make ORT more accessible.

One of the problems is that the medical establishment is still reluctant to accept ORS. In the United States, for example, it costs almost 10 times as much to treat dehydration with an intravenous drip in a hospital as it does to administer ORS, yet the intravenous method prevails. Drug companies, too, stand to gain more by selling antidiarrhoeal drugs, most of which are useless and some of which are dangerous.

Around 8,000 children still die each day from diarrhoeal dehydration, a toll the world can and must reduce with ORT.

Photo: A Cambodian mother feeds oral rehydration salts to her dehydrated child.

1930s. This slow-down was transmitted to the developing countries, and one major consequence was an international debt crisis—sparked off in 1982 when Mexico suspended interest payments on an accumulating mountain of debt. As a result, many African and Latin American countries were hit by recession and directives that they structurally adjust their economies. The situation had severe implications for the poor, in time prompting a call similar to that of the 'emergency for children' in the 1970s: 'adjustment with a human face'. The concept responded so persuasively to the anxiety about what was happening to vulnerable groups in developing countries that it quickly entered the lexicon of international development. In a very real sense, it served to take UNICEF into the mainstream of economic and social policy-making, giving UNICEF a voice and credibility not experienced before in these circles.

At the same time, there were emerging signs of hope for the children's cause. The evolution of the 'basic services' and PHC approaches had given the practitioners of social and human development a new sense of purpose. And the success of the 1979 International Year of the Child implied that the time was ripe for a new push on behalf of children. UNICEF's new Executive Director, James P. Grant, was determined to capitalize on these opportunities.

In December 1982, in his annual *State of the World's Children* report, James Grant launched an initiative known as the child survival revolution, later including child development. This campaign reversed conventional wisdom. Rates of infant and young child mortality had previously been seen as measurements of a country's development. Now UNICEF suggested a direct attack on infant and child mortality as

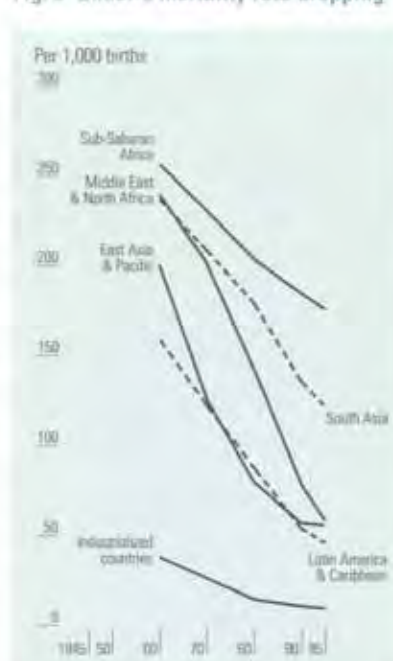

an instrument of development.

In a throw-back to the great disease campaigns of the 1950s, UNICEF now proposed to vanquish common infections of early childhood using simple medical technologies. From the primary health care package, it singled out four techniques, which collectively were referred to as 'GOBI': 'G' for growth monitoring to keep a regular check on child well-being; 'O' for oral rehydration therapy to treat bouts of childhood diarrhoea; 'B' for breastfeeding as the perfect nutritional start in life; and 'I' for immunization against the six vaccine-preventable childhood killers: tuberculosis, diphtheria, whooping cough, tetanus, polio and measles. One of the strengths of this prescription was that all the techniques were low cost.

Initially, some members of the international public health community had reservations about the 'child survival and development revolution'. They were concerned about its narrow emphasis on a few primary health care ingredients. But the cause of child survival found an extraordinary degree of worldwide resonance, gathering a wide range of allies—national, international, bilateral, non-governmental—and from all walks of public and professional life.

This accumulation of popular and political support was not accidental. It was the result of a sophisticated use of communications, taking advantage of two fundamental developments over previous decades. First, there had been a dramatic expansion worldwide of basic education. Second, a media revolution had brought millions more people within reach of radio and television. Previous strategies had been hampered by the difficulty of 'imposing' health on unreceptive populations. But at this point, the new communications channels

Fig. 9 Under-5 mortality rate dropping

The under-5 mortality rate per 1,000 births has decreased in every region. In the Middle East and North Africa region, the rate is now only a quarter of what it was in 1960.

Fig. 10 Total under-5 deaths down

Under-5 deaths are declining everywhere except in sub-Saharan Africa, where a strong increase in births has meant a rise in total deaths.

Source for both figures: UNICEF

Fig. 11 Measles immunization high and holding

The percentage of the developing world's children under one who are protected against measles increased dramatically during the 1980s, and the coverage level achieved by 1990 is being maintained.

opened up a different option—persuasion.

During the 1980s, UNICEF developed and fine-tuned a strategy of social mobilization. Not only did it enlist the media and advertising industries, it also invited partners from every nook and cranny of society—from religious leaders to Goodwill Ambassadors, from Heads of State to municipal mayors, from sports personalities to parliamentarians, from professional associations to trade unions—to join the child survival and development movement and spread its message.

At the international level, a Task Force for Child Survival and Development, including all the big-league players in international health—the Rockefeller Foundation, UNDP, UNICEF, the World Bank and WHO—was established to resolve technical issues associated with the campaign and help build its momentum. The campaign thus became far broader than UNICEF itself, which explains the use of the vivid phrase, 'a grand alliance for children'.

But whatever the power of the alliance, much of its success was still due to the extraordinary energy that James Grant injected into it personally and with which he infected others. His visits to scores of presidents and prime ministers did much to raise the visibility of the children's cause, and systematic lobbying within regional bodies such as the Association of South-East Asian Nations (ASEAN), the League of Arab States (LAS), the Organization of American States (OAS), the Organization of African Unity (OAU), the Organization of the Islamic Conference (OIC) and the South Asian Association for Regional Cooperation (SAARC) helped build political will.

In November 1985, at a special ceremony to commemorate the UN's 40th anniversary, nations recom-

mitted themselves to the target originally set in 1977—universal child immunization (UCI) by 1990. Of the four GOBI elements, the expanded programme on immunization (EPI) had been taken up with the greatest enthusiasm in the largest number of countries, including the most populous on earth, China and India.

From an average at the beginning of the decade of 15 per cent immunization coverage, some developing countries had already pushed their rates to 60 per cent or more. A goal that a few years before seemed completely unattainable was now within striking distance.

During the rest of the 1980s, scores of developing countries conducted an all-out drive to reach a coverage of 80 per cent child immunization or more (75 per cent in Africa). This international effort, described as perhaps the greatest mobilization in peacetime history, succeeded in spite of the major cut-backs in social services necessitated by the economic recession and adjustment crisis.

Some voices were raised against the disproportionate share of public health resources used for childhood immunization. But the energy behind the campaign was such that in practice it spilled over into almost every area of maternal and child well-being—carrying in its wake a much wider range of primary health care services.

Towards the end of the decade, optimism was warranted on several fronts. Nutritional progress was encouraging enough to permit the World Summit to establish the goal of halving the 1990 rate of child malnutrition by the year 2000. Many countries in Latin America and the Caribbean and in Asia are improving child nutrition. Indeed, during the 1980s, nutritional status improved in every region of the world (only marginally in sub-Saharan

UNICEF and the stars

UNICEF/ALAN PETER

For most of its 50 years, UNICEF has benefited greatly from the support of internationally known personalities. Danny Kaye pioneered the role, as UNICEF's first Ambassador at large. For over three decades, beginning in 1953, he helped represent UNICEF and the needs of children in the international community. Audrey Hepburn also served as Goodwill Ambassador for UNICEF, from 1988 until her untimely death in January 1993. Her deeply sensitive appeals for children while visiting Ethiopia, Somalia and the Sudan cannot be forgotten.

UNICEF now has five Goodwill Ambassadors, personal representatives of the UNICEF Executive Director, volunteering their time and talents to draw the public's attention to the needs of children.

Current Ambassadors

► *Sir Peter Ustinov*—Goodwill Ambassador for over 25 years, he has won awards for his uniquely entertaining UNICEF public service announcements and for special documentaries on the situ-

ation of children in China and Russia. He represents UNICEF in numerous forums.

► *Liv Ullmann*—One of the first outsiders to visit refugee camps in Kampuchea in 1979, she also helped draw attention to a little-publicized famine in Ethiopia when she was photographed with children there in the mid-1980s. She continues her advocacy for children.

► *Tetsuko Kuroyanagi*—A well-known Japanese television personality, she has raised more than US\$20 million in Japan through programmes about the UNICEF-supported projects she has visited.

► *Harry Belafonte*—A strong UNICEF voice for Africa in concert appearances and in special appeals, he has most recently advocated for the children of Rwanda.

► *Lord Attenborough*—Became familiar with UNICEF's work while making the films *Gandhi* in India and *Cry Freedom* in South Africa; both have been successful benefit fund-raisers for UNICEF.

In addition, a number of celebrated actors, artists, singers and sports figures

donate their talents to advocate for children on behalf of UNICEF as **Special Representatives**, including:

► *Roger Moore*—A tireless advocate for children on many issues, he has become the major spokesperson for the Kiwanis-UNICEF initiative to eliminate iodine deficiency disorders (IDD).

► *Sir Edmund Hillary*—Has been giving special support to the salt iodization initiative to protect children from IDD in the Himalayas.

► *Vanessa Redgrave*—Has raised funds and public awareness for children in former Yugoslavia through a series of events in Bosnia and Herzegovina, and Croatia, as well as in London and New York.

► *Judy Collins*—Recently visited children in Viet Nam, has also been an envoy for peace in Bosnia and Herzegovina and Croatia, supporting the book *I dream of peace* on the wartime experiences of children. (See also page 15.)

► *Imran Khan*—Has used his international profile in cricket to support health and immunization programmes in Bangladesh, Pakistan, Sri Lanka and Thailand.

► *Johann Olav Koss*—The voice of UNICEF's Olympic Aid support programme for the 1996 Olympic Games in Atlanta.

► *Mario Kreutzberger*—Includes messages for UNICEF in his popular television programme "Sabado Gigante", reaching a huge audience in Latin America and other Spanish-speaking countries.

Julio Iglesias, Leon Lai, Nana Mouskouri and *Yousou N'Dour* are other performers who have given generously of their time and talents in benefit concerts and appearances for UNICEF.

Africa), and in every category of malnutrition except anaemia.

Moreover, extraordinary improvements were made in access to safe drinking water. According to WHO's end-of-decade review, between 1981 and 1990, the proportions of families with access to safe drinking water rose from 38 to 66 per cent in South-East Asia, from 66 to 79 per cent in Latin America, and from 32 to 45 per cent in Africa.

In total, during the International Drinking Water Supply and Sanitation Decade (1981-1990), an additional 1.2 billion people gained access to safe water, and about 770 million to adequate sanitation. This has continued in the 1990s, so that by 1994, a further 780 million gained access to water.

By the end of the decade, the child survival and development revolution was estimated to have saved the lives of 12 million children. However, it was never aimed exclusively at saving children's lives and preventing childhood disease and disability. The wider purpose of the revolution was to revitalize the flagging cause of human-centred development and to place children at the leading edge.

One result was the international conference held in 1990 under the auspices of UNDP, UNESCO, UNICEF and the World Bank in Jomtien (Thailand), which set the target of 'Education for All by the Year 2000'. And in subsequent years, the World Bank tripled its lending for basic education to US\$1 billion.

Also in 1990, UNDP brought out its first annual *Human Development Report*, which declared human beings to be both the means and the ends of development. Human, rather than economic, prospects were once again beginning to take pride of place.

The momentum behind human-centred development was particu-

larly sustained by the activities of women. International organizations such as UNICEF began to recognize that women had an importance that went beyond their biologically or socially determined maternal roles; that women were also economic providers, organizers and leaders. In many parts of the developing world, women made up one third of heads of households.

Thus far, the development process had pushed women to the margins. This not only excluded them from social and economic participation but it also acted as a powerful brake on development in general. Future progress would mean, therefore, that investment would have to be affirmatively structured in favour of women: that development would have to be 'gendered'.

This had major implications for UNICEF. Its child survival and development prescription did have two elements that directly supported the women's agenda—female education and birth spacing. But for the much more important GOBI ingredients, women were cast in an exclusively maternal role. Throughout the 1980s, UNICEF resisted becoming involved in the mainstream of the women's cause. Towards the end of the decade, however, it re-evaluated its policy on women in development to take on the language and dynamic of women's rights, with a special focus on girls.

The movement in the direction of women's rights also coincided with mounting pressure for the rights of children, which had hung fire somewhat in the years following the 1959 Declaration of the Rights of the Child but had been rekindled by IYC. The NGO community working on behalf of children took advantage of this renewed concern for children to argue that special protection for children should be more than a high-sounding principle; it

UNICEF/UIS/Syngma

Global immunization reached an average 80 per cent of children in 1990, achieved through national campaigns, immunization days and other intensive efforts. Children were immunized at school in Thailand.

should also be enshrined in law.

Population growth and rapid rates of industrialization were putting increasing pressures on childhood and family life. The most conspicuous symptom of social stress and family breakdown was the increasing number of children working on city streets—with some also living there. In Latin America, where the phenomenon was at its most acute, there were thought to be several million street children.

Meanwhile, many other children were also being damaged by forces that went beyond the general rubric of poverty and underdevelopment. These included child victims of mass violence and warfare, and children with disabilities. They also included children suffering from exploitation—as workers and labourers, or as objects of commercial sexual gratification. In the mid-1980s, UNICEF coined a new term to cover all these categories of childhood disadvantage—children in especially difficult circumstances (CEDC).

At this point, UNICEF began to analyse CEDC situations and evolve policy responses. The international children's NGOs, on the other hand, were more concerned with advocacy and legislation to protect these children and bring their exploiters to book. After IYC, they had helped establish an inter-governmental group under the auspices of the UN Commission on Human Rights, which had begun to draft a convention to replace the 1959 Declaration of the Rights of the Child. The NGOs' input was critical to this process and helped to keep it moving.

In 1987, recognizing the potential convergence of the child survival and development revolution with the thrust for children's rights, UNICEF threw its weight into the child rights ring. Although its support arrived relatively late,

UNICEF's capacity for international mobilization was decisive.

In 1989, the UN General Assembly adopted the Convention on the Rights of the Child. On 2 September 1990, the Convention entered into force as international law. Within a year, more than 90 countries had ratified, and by end-September 1995 the total was 179. No human rights convention has ever attained such widespread ratification, nor so quickly.

Almost simultaneously, the campaign for child survival and development reached a peak. On 30 September 1990, 71 Heads of State or Government took their seats at a World Summit for Children. The climax of the occasion, held under the auspices of the UN in New York, was the joint signing of a World Declaration and 10-point Plan of Action comprising a set of child-related human development goals for the year 2000. These included targeted reductions in infant and maternal mortality, child malnutrition and illiteracy, as well as targeted levels of access to basic services for health and family planning, education, water and sanitation.

The Summit was one of the most important events in UNICEF's history: it marked the moment at which children's issues had reached such a high point on the international agenda that there seemed nowhere higher for them to go.

The immediate post-cold war period was a time of great optimism in international affairs. But it was also a time at which the wider development movement had reached a nadir. In the face of debt and structural adjustment, environmental degradation, the deepening crisis in Africa and the onset of AIDS, the 1980s had been labelled development's 'lost decade'. But for children, the 1980s was the decade in which their cause was not lost, but re-found.

LATIN AMERICA AND THE CARIBBEAN

- ▶ Over the past 50 years, children in Latin America have benefited from two major advantages compared to those in other regions: better educated parents, especially mothers, and a high degree of urbanization.
- ▶ The net primary enrolment ratio for girls increased from 57 per cent to 87 per cent between 1960 and 1990. Their secondary enrolment ratio is 49 per cent, the highest among the developing regions. The gender gap at both primary and secondary levels is very small.
- ▶ The mortality rate of children under age five was 15 per cent in 1960 and 5 per cent in 1993, the lowest in the developing world.
- ▶ In 1981, 45 per cent of children were immunized against vaccine-preventable diseases; in 1993, the rate of immunization had increased to 80 per cent. Polio was eliminated from the region in 1994.
- ▶ On average, a mother had 6 children in 1950; in 1990, the average was 3.
- ▶ Interregional differences remain stark. A Cuban can expect to live as long as a Dane, whereas a Peruvian's prospects are not much better than those of a person in Botswana. In Brazil, a poor child is five times more likely to die before the first birthday than a rich child; in Venezuela, a poor child is 10 times more likely to be malnourished than a rich one.

COUNTRIES IN TRANSITION

- ▶ During the three decades following World War II, Eastern Europe achieved almost universal access to basic social services for children. By the early 1970s, malnutrition and illiteracy were almost eradicated, the literacy rate and primary school enrolment ratio were above 90 per cent. In the early 1980s, the immunization rate was the highest of all regions.
- ▶ By the 1970s, social conditions had approached those in industrialized countries. Poor economic growth and widespread inefficiencies in the 1980s and turmoil following the political transition in the 1990s, however, have caused serious deterioration.
- ▶ Diphtheria, polio, respiratory illnesses and cholera are on the rise. The immunization rate has declined from 88 per cent in the mid-1980s to 77 per cent in the early 1990s.
- ▶ Since 1990, child mortality has increased in Albania, Russia and Ukraine. In other countries, easily treatable respiratory illnesses have again become the leading cause of infant mortality.
- ▶ In Russia and Ukraine, the life expectancy of men dropped by five years between 1989 and 1993 to a level actually lower than the official retirement age.

The 1990s: A decade for children's rights

Within three years of the World Summit for Children, 105 industrialized and developing countries, covering a total of 88 per cent of the world's children, had prepared national programmes of action (NPAs) for meeting the World Summit goals. In many cases, governments had used the process to bring together different sectors of society—governmental and non-governmental—in a joint endeavour. In some countries, Brazil and India for example, the same process also took place at state and even municipal levels.

The Summit had certainly been a star-studded and spectacular event. But it has not been allowed to vanish into the past as a one-off occurrence. Instead, it was used as a launching pad for a wider process of planning and commitment for children. In the 1960s, UNICEF had found it difficult to gain serious attention for such an idea. In the 1990s, however, Heads of State have given it their imprimatur, and made a strong commitment to the defence of children and reaching goals on their behalf—some world leaders even identifying these with their own personal political platforms.

Meanwhile, in a replay of the 1970s, the 1990s have become a decade in which the response of the UN system to the flagging development movement has been to embark on a series of global conferences. The UN Conference on Environment and Development (Rio de Janeiro, 1992) was followed by conferences on nutrition (Rome, 1992); human rights (Vienna, 1993); population and development (Cairo, 1994); social development (Copenhagen, March 1995); and women (Beijing, September 1995). Still to come is the 'City Summit'

(Istanbul, June 1996). During the preparatory stages for all these conferences and at the meetings themselves, UNICEF has done its best to keep children's concerns prominently in view, actively promoting the social agenda encapsulated in the Declaration of the World Summit for Children.

In addition, a set of mid-decade goals for children has been established, starting with regional meetings in Africa and South Asia. In September 1993, on the third Summit anniversary, the United Nations Secretary-General convened a round table in New York called *Keeping the Promise to Children*, which reiterated the commitment to the Summit goals and endorsed mid-decade targets. These include universal ratification of the Convention on the Rights of the Child, and progress towards universal primary education, as well as targets for the control of specific diseases and nutritional deficiencies. By mid-decade, the aim was to have eradicated, or reduced by a specified amount, neonatal tetanus, malnutrition, polio, vitamin A deficiency, guinea worm disease and iodine deficiency disorders, as well as diarrhoeal and vaccine-preventable diseases (Panel 15).

The funding strategy for attaining these goals has been described as 'the 20/20 initiative': a call for developing countries to direct at least 20 per cent of their budgets to basic needs, and for industrialized countries to earmark 20 per cent of their development assistance for the same purpose. The 20/20 initiative has also gathered international support. In 1995 at the World Summit for Social Development in Copenhagen, UNDP, UNESCO, the United Nations Population Fund (UNFPA), UNICEF and WHO all backed it as a means of generating sufficient additional resources (US\$30 billion-US\$40 billion per

Making child rights constitutional in Brazil

UNICEF/UNICEF.org

In Brazil, for decades, there had been pressure from NGOs and children's organizations for protecting children battered by poverty and hunger and despised by sections of the community. The most vulnerable children were those living or working on the streets. Often subjected to violence and repression from the police and armed groups, they and their advocates mounted the call for reform. In 1985, they founded the National Street Children's Movement, which in 1986 held its first Congress in Brasilia.

Brazil had then just emerged from 21 years of authoritarian rule and was in the process of drafting a new democratic Constitution. It was a golden opportunity for children to enshrine their rights in law. Even so, it was a daunting task. UNICEF played an important role in strengthening and broadening the alliance of institutions working for children and provided technical support for the drafting process.

The campaign received a boost in 1986 when the Government established a National Committee on the Child and the

Constitution. Along with representatives from government ministries, a wide variety of NGOs participated, including the National Street Children's Movement. UNICEF worked with the Committee in a number of ways: providing a secretariat and technical assistance, recruiting private sector support and helping widen the network of groups and organizations involved.

This momentum led to a widespread public campaign—including mass gatherings of children in a number of cities, as well as demonstrations in front of the National Congress. Organizations and NGOs from around the country proposed drafts for two constitutional amendments, which were endorsed by 200,000 voters and presented to the Constituent Assembly. These proposals ultimately became the chapter on the rights of children and adolescents in the Constitution—passed by a vote of 435 to 8.

The success of the Constitution was followed by an even greater victory two years later, when the *Statute of the Child*

and Adolescent was approved by both houses of the National Congress, legally obligating the Government to protect child rights. Children were involved in gaining its acceptance, with more than 5,000 meeting in Brasilia. João de Deus, one of the organizers, recalls, "The day the children occupied the Senate was the most important day of my life...There were congressmen crying who gave up their seats to the children."

The *Statute* defines children as citizens with clearly stated rights to respect, dignity and freedom. It also gives precedence to important needs in a child's life, such as health, education, sports and leisure. Special provisions guarantee children's protection as a matter of "absolute priority."

To ensure that the *Statute's* provisions are enforced, Councils for the Rights of the Child and Adolescent were set up at federal, state and local levels, with members drawn from diverse backgrounds. These Councils have the authority to spend an allocated budget and to raise additional funds. This strengthens their work and helps provide protection for the most vulnerable children.

Upon this strong foundation, the Councils now face the challenge of continuing to transform and put into practice the nation's commitment towards its children as expressed in the Constitution.

Photo: Poverty forces vulnerable families on to the streets.

UNICEF/95-0024/Munir-Lee

The Convention on the Rights of the Child recognizes the right of children to be protected against hazardous and exploitative labour, which is still the norm in many parts of the world.

annum) to ensure that by the end of the century everyone would have access to basic social services. A number of national governments have endorsed these principles and committed themselves to move in the 20/20 direction.

The establishment of mid-decade goals has been, in part, a manoeuvre to sustain the energy of the post-Summit process. In 1996, countries are due to report formally at the UN on their progress towards the goals for the year 2000. In many instances, this will be a report of some triumph: WHO reported on World Health Day in April 1995 that 146 countries have had no cases of polio for at least a year. Most of Asia has already made significant progress towards the goals, and many countries in East and South-East Asia have already achieved most of them.

Many countries in Latin America have also made considerable advances, as have many in the Middle East, albeit more selectively. In sub-Saharan Africa, the prospects are not good, though even there, with increased surveillance and national immunization campaigns, several countries will show improvement in at least half the goals.

But even with a renewed sense of commitment, it must be admitted that it will be difficult for many countries to bring about the reductions in child mortality, disease rates and illiteracy to which they committed themselves in 1990. Some African countries are in such a state of turmoil and economic crisis that for their leaders the vision of the Summit goals has already sunk below the horizon. UNICEF will, therefore, for the rest of the decade continue to put much of its energies into helping countries reach their child-centred targets.

The Convention on the Rights of the Child has already proved to be an effective framework for international action. With 179 countries

having ratified it as of end-September 1995, universal ratification is within sight—and the focus is already shifting to implementation, encouraging all countries to live up to their most basic commitments to children. The Convention has evolved from a set of remote aspirational norms into a practical working instrument.

The Convention has established social and economic rights—the right to survival, early development, education, health care and social welfare support. It has also covered civil and political rights. These include the right of the child to a name and nationality, to freedom of expression, to participation in decisions affecting his or her well-being, and to protection from discrimination on grounds of gender, race or minority status, as well as protection from sexual and other forms of exploitation.

The key underlying advance is the recognition of the child as a complete individual. The Convention establishes that the child has an identity distinct from those of parents or nurturers and that the community has a duty to protect that identity and to enable the child to express it in matters such as guardianship or custody. In these areas, the overarching consideration should be “the best interests of the child.”

In the early 1980s, the group of rights that UNICEF was most anxious to promote—and upon whose inclusion in the Convention it had insisted—were child rights to survival and development. The Convention asserts on behalf of children that their basic rights to health and education should ultimately be guaranteed by the State. When UNICEF could see those rights converging with the campaign for child survival and development, it gave the Convention energetic support both in the final drafting stages and

also after adoption by the General Assembly.

This happy twinning of the primary focus of UNICEF with the emergence of the Convention has given great power to the pursuit of children's issues in the 1990s. The goals remain at the heart of the agenda: they flow so organically from the Convention itself as to confer upon the Convention a special legitimacy. And because the goals operate within a specific time-frame, the Convention is blessed with an immediate applicability to the lives children lead.

UNICEF has actively pursued universal ratification, with the support of many NGOs. In the process, UNICEF has become strongly identified with the cause of child rights in ways that have important implications for its future work in both industrialized and developing countries. It has, for example, heightened its concern for children in especially difficult circumstances—abandoned children, children caught up in the violence of war, street children, children subject to special forms of abuse and discrimination and child victims of hazardous labour and sexual exploitation. To develop strategies to combat this most crushing form of exploitation, UNICEF is co-sponsoring the first ever World Congress on Commercial Sexual Exploitation of Children (Stockholm, August 1996).

This new attention to children's needs from a rights perspective means that in industrialized countries, as well as in the developing world, UNICEF has become much more of an advocate for children—injecting a new dimension into the work of its National Committees. UNICEF has also been supporting the work of the Committee on the Rights of the Child, the body that monitors ratifying countries as they move towards full implementation of the Convention.

The post-Summit process and the Convention on the Rights of the Child are helping to maintain the momentum on behalf of children. Even so, in the 1990s the prospects for the fight against poverty generally appear mixed. As in the case of progress towards the year 2000 goals, success in the struggle to ameliorate the human condition varies greatly between and among both regions and countries. While it is gratifying to recognize the substantial progress made in China, India and many other parts of Asia (which, after all, collectively represent half the world's children), it would be a mistake to fail to acknowledge that poverty is actually deepening in other regions of the world.

Early in the decade, the euphoria surrounding the immediate end of the cold war soon wore off. A world freed from the rigidities of super-power stand-off was now faced with the implosion of the USSR and the growing ethnic and nationalist turmoil in former Yugoslavia and elsewhere. In Europe, war re-emerged after an absence of 50 years, and those countries engaged in the transition from central planning to a free market found it a painful experience. The cold war thaw had briefly suggested that there might be a 'peace dividend' as expenditure on weapons was switched to development. But this idea vanished almost as soon as it had surfaced, and certainly did not long survive the costly hostilities of the Persian Gulf war.

In Africa, the 1990s have seen the end of apartheid in South Africa, with potential benefits for peace in the entire subregion, and a new development dynamism. However, the optimism this has generated has been counterbalanced by deepening crises elsewhere. Already during the 1980s, the continent had suffered from a seemingly endless

INDUSTRIALIZED COUNTRIES

► At the end of World War II, poor health and deprivation were common in many of today's industrialized countries. The infant mortality rate in southern Europe in the early 1950s was 80 per 1,000 births, twice as high as in Latin America today (38 per 1,000). Strong economic growth and the Welfare State reduced it dramatically.

► The number of children dying before age five declined from 43 to 9 per 1,000 between 1960 and 1993. Life expectancy rose from 67 to 77 years between 1950 and 1990.

► Primary education is universal; secondary enrolment reached 86 per cent in 1990.

► On average, a woman had 3.6 children in the early 1950s and 2 by 1975. In southern Europe, the sharpest decline came after 1975. In Spain, fertility has dropped from 2.9 to 1.2 over the last 20 years.

► Children in industrialized countries now face new problems, such as sharply increasing divorce rates, erosion of community, greater dependence on television and increasing alcohol and drug abuse.

► Slow economic growth, rising unemployment, worsening income distribution and more single-parent families have led to an increase in child poverty since 1980. In the US, an estimated 20 per cent of all children are defined as living in poverty.

UNICEF National Committees: A network for children

UNICEF is unique in the UN system in having a very sturdy, supportive network of private citizens—its National Committees. Currently, there are Committees for UNICEF in 38 industrialized countries. Autonomous non-governmental organizations (NGOs), they are recognized by their Governments and operate under formal relations with UNICEF. They vary in size, style and structure; some are nearly as old as UNICEF itself, and others have been formed within the last year. Yet all share a common purpose. They enable people, in their private capacities, to participate in United Nations efforts to save and improve the lives of children throughout the world.

The Committees are the main voice of UNICEF among the public in the richer countries. In addition to paid staff, they engage the efforts of more than 100,000 volunteers. They help raise awareness about the situation facing children in countries UNICEF assists and, increasingly, about the rights of children everywhere. In their own countries, they maintain contacts

with the media, organize seminars, support education for development in schools and work with judicial, political and educational institutions on the development issues prioritized by UNICEF.

National Committees also raise funds. In 1994, they contributed almost 30 per cent of UNICEF's overall income. Indeed, of the top 15 donors to UNICEF, including governments, six are National Committees, some of which provided UNICEF with substantially larger contributions than their Governments.

The sole recipients of funds raised by the Committees have always been children in developing countries. The beneficiaries of Committees' knowledge and advocacy form a far broader group, however, including children in their own countries.

The Convention on the Rights of the Child enables Committees to work on rights issues that affect children in both industrialized and developing countries. Commercial sexual exploitation of children (including sex tourism), child labour,

intercultural tolerance, the impact of war on children and the effects of land-mines on children are but a few of these.

A number of National Committees also were instrumental in the process leading to their governments' ratification of the Convention. Since then, many have become involved in the required formal process of governmental reporting on progress towards implementing the Convention.

Several Committees have helped form or have joined powerful coalitions of NGOs and other groups interested in child rights. These are becoming increasingly useful sources of knowledge and expertise for governments and interested citizens.

One example of the new role of Committees is their involvement in the movement against anti-personnel land-mines. In Belgium, Denmark, Ireland and Sweden, campaigns supported by Committees have prompted those Governments to move towards a total ban on anti-personnel mines. In Austria, France, Germany, Ireland and the United Kingdom, for example, public advocacy and political pressure by Committees and their NGO partners have forced Governments to propose much tougher restrictions on the use and supply of mines.

The National Committees have been crucial to UNICEF for decades. They help give form to a spontaneous human response to the plight of some of the world's most disadvantaged children.

Photo: The sole recipients of funds raised by National Committees are the children of the developing world.

succession of emergencies—mostly caused by, or associated with, drought. Africa's fortunes were further worsened by the continuing fall in commodity prices, which made it impossible for most countries to make much economic progress or shake off the heavy burden of debt. Worse was to follow in the form of political breakdown. In the 1990s, the collapse of frail political and administrative structures has pushed a number of countries—Liberia, Rwanda, Sierra Leone and Somalia—towards the ultimate condition of post-colonial breakdown: the 'failed State'.

In these emergency arenas, the children's agenda has been dominated by the combination of war with ongoing economic and environmental disaster. This has dashed developmental prospects and redirected attention towards specific child rights issues, in particular: children and land-mines, children and soldiering, and children lost or forced to flee because of fighting. In addition to considering what services children need, UNICEF has also been involved in the struggle to create humanitarian spaces—'zones of peace'—in which some minimum services at least can be delivered. To an organization born among the detritus of war, it sometimes seems as if the historical wheel has come full circle.

Towards 2000 and beyond

In a world whose post-colonial complexion has been radically transformed, the fight against world poverty can no longer be viewed uniformly. Global analyses of social and economic phenomena appear simplistic and often out of date. Increasingly refined methods of data collection, as well as careful situation analysis, programme planning and evaluation, all offer one clear

message—that there is no such thing as a development formula.

Effective responses to problems of poverty have to derive from regional, national and local realities. The days of universal prescriptions are over. The keynotes for the future will be based on recognition of diversity—on adapting strategies to local circumstances and devolving decision-making so as to empower individuals and communities. This in turn will have a profound effect on future forms of international co-operation.

In many countries, the potential of health technology to improve the lives of children will largely have been realized before the end of the century. Polio has already been eliminated from the Americas and can be eliminated elsewhere. Guinea worm disease and iodine deficiency disorders are dwindling. The greater use of oral rehydration salts (ORS) means that diarrhoeal diseases such as cholera no longer represent the threat they once did; the greater availability of antibiotics means that respiratory infections are on the run. Other threats—malaria and AIDS—still remain, and the search for preventives and cures goes on.

But by the year 2000, it is conceivable that—in so far as it is technologically practicable—the promise of 'Health for All' will have been delivered. If that happens (though it remains a Herculean task), it will owe much to WHO and UNICEF, and the mobilizing power of the children's cause.

But other parts of the anti-poverty quest are more complex—and less susceptible to technical intervention. The eradication of such symptoms of poverty as illiteracy, environmental squalor, food insecurity and the exploitation of children in the workplace are challenges of a different order. That effort will benefit from the same kind of energy and commitment as

The keynotes for the future will be based on recognition of diversity—on adapting strategies to local circumstances and devolving decision-making so as to empower individuals and communities.

Fig. 12 Primary school enrolment rises

School enrolment of 6- to 11-year-olds improved greatly from 1950 to 1995 in all regions. Some gains were lost in the late 1980s and early 1990s in sub-Saharan Africa. However, the region's enrolment rate has still doubled over the last 45 years.

Fig. 13 Boys/girls enrolment gap narrows

The gap between male and female primary school enrolment rates has narrowed between 1960 and 1995. In South Asia, the gap was nearly 30 points in 1960, dropping to 19 points in 1995. There and in the Arab States, however, the percentage point difference is still more than 10.

Source for both figures: UNESCO, *Trends and projections of enrolment by level of education, by age and by sex, 1960-2025* (as assessed in 1993), report BPE-94/WS.1, Paris, 1993

was applied to the child health agenda. In that context, UNICEF has been systematically addressing each of those challenges, but they cannot just be mechanistically 'fixed'. They will demand significant changes in social attitudes and behaviours.

To some extent, the same is true even in the health area. All mass public health campaigns, however smart their technology, depend to a greater or lesser degree on the cooperative behaviour of human beings. And even the most effective health education and information campaigns tend to reach not more than a certain proportion of their target populations. That proportion may be very high: 80 per cent, 90 per cent, even 95 per cent for some vaccination campaigns.

In the case of some infectious agents, this may be enough to reduce their presence in a population to the point where the disease spontaneously dies out. In other cases, it will not.

The final 10 per cent of children or households still unreached by measles vaccine, or ORS packets, or sanitary latrines, or basic nutrition, may be as difficult to reach as the first 90 per cent—and also take as long and cost as much.

This final part of any campaign is usually a hard and grinding slog, with little of the glamour of the spectacular initial attack. 'Health for All' or 'Education for All' cannot be allowed to stop short at health or education for the majority. But it does demand a different approach—replacing the universalist philosophy with one that specifically identifies and targets the unreached.

This is where the twin movements on behalf of children—one based on 'rights', the other on 'needs'—coalesce.

The rights approach focuses on those who are disadvantaged by

denial of specific legally constituted rights. But reaching children with 'basic needs' will—under the terms of the Convention on the Rights of the Child—target a virtually identical group.

It is no coincidence that those children today categorized as being most vulnerable to society's deprivations are the children in greatest need of, and with least access to, services of health, education and social welfare.

Those who are disadvantaged by unmet rights and those who are disadvantaged by unmet needs are ultimately the same children. Within the next few years, these two strands of disadvantage seem destined to mesh. And the implication is that, wherever the development quest goes, the world will still be looking in the direction of children and their future.

Over the past decade, children's emergence as a topic of public and political concern has been truly striking. In the past, the idea of statesmen sitting at a conference table to discuss the well-being of children would have been greeted with amazement if not derision. Compared with the waging of wars, the strength of the dollar, the price of oil, or the signing of NAFTAs or Maastrichts, the subject of children was regarded as trivial.

Indeed, times have changed. Most ministers and leaders around the world take the subject of children seriously. Today, the public policy agenda and the media in developing and industrialized countries alike are crowded with children's issues.

The 1990 World Summit for Children and the passage of the Convention on the Rights of the Child were symbols of that newfound prominence, and both have served to consolidate the presence of children and young people in political and social debate.

Girls' education: A lifeline to development

UNICEF/WHO/UNEP/UNFPA

Education is one of the most critical areas of empowerment for women, as both the Cairo and Beijing conferences affirmed. It is also an area that offers some of the clearest examples of discrimination women suffer. Among children not attending school there are twice as many girls as boys, and among illiterate adults there are twice as many women as men.

Offering girls basic education is one sure way of giving them much greater power—of enabling them to make genuine choices over the kinds of lives they wish to lead. This is not a luxury. The Convention on the Rights of the Child and the Convention on the Elimination of All Forms of Discrimination against Women establish it as a basic human right.

That women might have the chance of a healthier and happier life should be reason enough for promoting girls' education. However, there are also important benefits for society as a whole. An educated woman has the skills, information and self-confidence that she needs to be a

better parent, worker and citizen.

An educated woman is, for example, likely to marry at a later age and have fewer children. Cross-country studies show that an extra year of schooling for girls reduces fertility rates by 5 to 10 per cent. And the children of an educated mother are more likely to survive. In India, for example, the infant mortality rate of babies whose mothers have received primary education is half that of children whose mothers are illiterate.

An educated woman will also be more productive at work—and better paid. Indeed, the dividend for educational investment is often higher for women than men. Studies from a number of countries suggest that an extra year of schooling will increase a woman's future earnings by about 15 per cent, compared with 11 per cent for a man.

Over recent decades there has certainly been significant progress in girls' education. Between 1970 and 1992, combined primary and secondary enrolment for girls in developing countries rose from

38 per cent to 68 per cent—with particularly high rates in East Asia (83 per cent) and Latin America (87 per cent). But there is still some way to go. In the least developed countries enrolment rates are only 47 per cent at the primary level and 12 per cent at the secondary level.

What would it take to improve girls' access to education? Experience in scores of countries shows the importance, among other things, of:

- ▶ *Parental and community involvement*—Families and communities must be important partners with schools in developing curriculum and managing children's education.

- ▶ *Low-cost and flexible timetables*—Basic education should be free or cost very little. Where possible, there should be stipends and scholarships to compensate families for the loss of girls' household labour. Also, school hours should be flexible so children can help at home and still attend classes.

- ▶ *Schools close to home, with women teachers*—Many parents worry about girls travelling long distances on their own. Many parents also prefer to have daughters taught by women.

- ▶ *Preparation for school*—Girls do best when they receive early childhood care, which enhances their self-esteem and prepares them for school.

- ▶ *Relevant curricula*—Learning materials should be relevant to the girl's background and be in the local language. They should also avoid reproducing gender stereotypes.

Photo: A girl from the Miao indigenous group attends primary school in China.

Social goals: 1995 and 2000

Goals for 1995

The following goals were accepted by almost all nations for achievement by the end of 1995. Great progress has been made.

- 1 Immunization against the six major vaccine-preventable diseases of childhood to reach at least 80 per cent in all countries.
- 2 Neonatal tetanus to be virtually eliminated.
- 3 Measles deaths to be reduced by 95 per cent and measles cases by 90 per cent (compared with pre-immunization levels).
- 4 The elimination of polio in selected countries and regions (as a step towards worldwide elimination by the year 2000).
- 5 The ending of free or low-cost distribution of breastmilk substitutes in all maternity units and hospitals, and the achievement of 'baby-friendly' status for all major hospitals.
- 6 The achievement of 80 per cent ORT use, as part of the effort to control diarrhoeal disease.
- 7 The virtual elimination of vitamin A deficiency.
- 8 The universal iodization of salt in countries affected by iodine deficiency disorders.
- 9 The virtual elimination of guinea worm disease.
- 10 The universal ratification of the Convention on the Rights of the Child.

Goals for the year 2000

The end-of-century goals, agreed to by almost all the world's governments following the 1990 World Summit for Children, may be summarized under 10 priority points.

- 1 A one-third reduction in 1990 under-five death rates (or to 70 per 1,000 live births, whichever is less).
- 2 A halving of 1990 maternal mortality rates.
- 3 A halving of 1990 rates of malnutrition among the world's under-fives (to include the elimination of micronutrient deficiencies, support for breastfeeding by all maternity units, and a reduction in the incidence of low birth weight to less than 10 per cent).
- 4 The achievement of 90 per cent immunization among under-ones, the eradication of polio, the elimination of neonatal tetanus, a 90 per cent reduction in measles cases, and a 95 per cent reduction in measles deaths (compared with pre-immunization levels).
- 5 A halving of child deaths caused by diarrhoeal diseases.
- 6 A one-third reduction in child deaths from acute respiratory infections.
- 7 Basic education for all children and completion of primary education by at least 80 per cent—girls as well as boys.
- 8 Safe water and sanitation for all communities.
- 9 Acceptance by all countries of the Convention on the Rights of the Child, including improved protection for children in especially difficult circumstances.
- 10 Universal access to high-quality family planning information and services in order to prevent pregnancies that are too early, too closely spaced, too late or too many.

The attention today accorded to children is not just because they are society's 'most vulnerable citizens' or humanity's 'most precious resource'. Nor is it just because of their size as a demographic subgroup. This attention is being accorded to children in their own right. Partly this is a reflection of long-term changes in societies all over the world.

Decades of modernization and urbanization have changed many attitudes. As a result of this century's vast improvements in child survival and development, parents have greater hopes for their children, and they expect more for them. And society is investing much more in their education and training.

This is no accident. As we come to the end of the decade, the education of children, especially girls, has become one of the centre-pieces of international development. The principle that education brings empowerment, and with it the opportunity to transform life, has been affirmed, strongly, by the global conferences at Cairo, Copenhagen

and Beijing. Seldom has the international community been so united as it is on the priority for universal primary education.

That is precisely what makes the future for children a realm of optimism rather than a crucible of despair. For the complex of reasons spanning 50 years, as set out in this report, it is now possible—in spite of the wars and the poverty—to believe that, ultimately, the world will not abandon, marginalize or depreciate children.

It has been a long struggle to have the lives of children taken seriously; it has consumed half a century to put children at the centre of the international development and human rights agenda.

But they are there, and nothing will now dislodge them. It is therefore possible to say, even amid the horrors of conflict and deprivation, that the 21st century will belong to children. It then remains to shape the policies and the programmes, the principles and the resources to give meaning to what has been achieved.

It is possible to say, even amid the horrors of conflict and deprivation, that the 21st century will belong to children.

UNICEF/IS5-0832/PH111

The challenge of helping Africa protect its children remains, as many countries face natural emergencies such as drought, complicated by economic and political crises.

General note on the data

The data provided in these tables are accompanied by definitions, sources and explanations of symbols. Tables derived from so many sources—12 major sources are listed in the explanatory material—will inevitably cover a wide range of data quality. Official government data received by the responsible United Nations agency have been used whenever possible. In the many cases where there are no reliable official figures, estimates made by the responsible United Nations agency have been used. Where such internationally standardized estimates do not exist, the tables draw on other sources, particularly data received from the appropriate UNICEF field office. Where possible, only comprehensive or representative national data have been used.

Data quality is likely to be adversely affected for countries that have recently

suffered from man-made or natural disasters. This is particularly so where basic country infrastructure has been fragmented or major population movements have occurred.

Data for life expectancy, crude birth and death rates, infant mortality rates, etc. are part of the regular work on estimates and projections undertaken by the United Nations Population Division. These and other internationally produced estimates are revised periodically, which explains why some of the data will differ from those found in earlier UNICEF publications.

Data for ORT use are undergoing review at WHO and UNICEF, so—with few exceptions—data appearing in table 3 of *The State of the World's Children 1995* have been repeated this year.

Explanation of symbols

Since the aim of this statistics chapter is to provide a broad picture of the situation of children and women worldwide, detailed data qualifications and footnotes are seen as more appropriate for inclusion elsewhere. Only two symbols are used in the tables.

- Data not available.
- x Indicates data that refer to years or periods other than those specified in the column heading, differ from the standard definition, or refer to only part of a country.

Note: Child mortality estimates for individual countries are primarily derived from data reported by the United Nations Population Division. In some cases, these estimates may differ from the latest national figures. In general, data released during approximately the last year are not incorporated in these estimates.

Index to countries

In the following tables, countries are ranked in descending order of their estimated 1994 under-five mortality rate. The reference numbers indicating that rank are given in the alphabetical list of countries below.

Afghanistan	5	Gambia	11	Norway	138

Measuring human development

An introduction to table 9

If development in the 1990s is to assume a more human face than there arises a corresponding need for a means of measuring human as well as economic progress. From UNICEF's point of view, in particular, there is a need for an agreed method of measuring the level of child well-being and its rate of change.

The under-five mortality rate (U5MR) is used in table 9 (next page) as the principal indicator of such progress.

The U5MR has several advantages. First, it measures an end result of the development process rather than an 'input' such as school enrolment level, per capita calorie availability, or the number of doctors per thousand population—all of which are means to an end.

Second, the U5MR is known to be the result of a wide variety of inputs: the nutritional health and the health knowledge of mothers; the level of immunization and ORT use; the availability of maternal and child health services (including prenatal care); income and food availability in the family; the availability of clean water and safe sanitation; and the overall safety of the child's environment.

Third, the U5MR is less susceptible than, say, per capita GNP to the fallacy of the average. This is because the natural scale does not allow the children of the rich to be one thousand times as likely to survive, even if the man-made scale does permit them to have one thousand times as much income. In other words, it is much more difficult for a wealthy minority to affect a nation's U5MR, and it therefore presents a more accurate, if far from perfect, picture of the health status of the majority of children (and of society as a whole).

For these reasons, the U5MR is chosen by UNICEF as its single most important indicator

of the state of a nation's children. That is why the statistical annex lists the nations of the world not in ascending order of their per capita GNP but in descending order of their under-five mortality rates.

The speed of progress in reducing the U5MR can be measured by calculating its average annual reduction rate (AARR). Unlike the comparison of absolute changes, the AARR reflects the fact that the lower limits to U5MR are approached only with increasing difficulty. As lower levels of under-five mortality are reached, for example, the same absolute reduction obviously represents a greater percentage of reduction. The AARR therefore shows a higher rate of progress for, say, a 10-point reduction if that reduction happens at a lower level of under-five mortality. (A fall in U5MR of 10 points from 100 to 90 represents a reduction of 10 per cent, whereas the same 10-point fall from 20 to 10 represents a reduction of 50 per cent).

When used in conjunction with GNP growth rates, the U5MR and its reduction rate can therefore give a picture of the progress being made by any country or region, and over any period of time, towards the satisfaction of some of the most essential of human needs.

As table 9 shows, there is no fixed relationship between the annual reduction rate of the U5MR and the annual rate of growth in per capita GNP. Such comparisons help to throw the emphasis on to the policies, priorities, and other factors which determine the ratio between economic and social progress.

Finally, the table gives the total fertility rate for each country and its average annual rate of reduction. It will be seen that many of the nations which have achieved significant reductions in their U5MR have also achieved significant reductions in fertility.

Table 9: The rate of progress

		Under-5 mortality rate					GNP per capita		Total fertility rate					
		average annual rate of reduction (%)					average annual growth rate (%)		average annual rate of reduction (%)

Definitions

Under-five mortality rate

Probability of dying between birth and exactly five years of age expressed per 1,000 live births.

Infant mortality rate

Probability of dying between birth and exactly one year of age expressed per 1,000 live births.

GNP

Gross national product, expressed in current United States dollars. GNP per capita growth rates are average annual growth rates that have been computed by fitting trend lines to the logarithmic values of GNP per capita at constant market prices for each year of the time period.

Life expectancy at birth

The number of years newborn children would live if subject to the mortality risks prevailing for the cross-section of population at the time of their birth.

Adult literacy rate

Percentage of persons aged 15 and over who can read and write.

Primary and secondary enrolment ratios

The gross enrolment ratio is the total number of children enrolled in a schooling level—whether or not they belong in the relevant age group for that level—expressed as a percentage of the total number of children in the relevant age group for that level. The net enrolment ratio is the total number of children enrolled in a schooling level who belong in the relevant age group, expressed as a percentage of the total number in that age group.

Income share

Percentage of income received by the 20 per cent of households with the highest income and by the 40 per cent of households with the lowest income.

Low birth weight

Less than 2,500 grams.

Underweight

Moderate and severe—below minus two standard deviations from median weight for age of reference population; *severe*—below minus three standard deviations from median weight for age of reference population.

Wasting

Moderate and severe—below minus two standard deviations from median weight for height of reference population.

Stunting

Moderate and severe—below minus two standard deviations from median height for age of reference population.

Total goitre rate

Percentage of children aged 6-11 with palpable or visible goitre. This is an indicator of iodine deficiency, which causes brain damage and mental retardation.

Access to health services

Percentage of the population that can reach appropriate local health services by the local means of transport in no more than one hour.

DPT

Diphtheria, pertussis (whooping cough) and tetanus.

ORT use

Percentage of all cases of diarrhoea in children under five years of age treated with oral rehydration salts or an appropriate household solution.

Children reaching grade 5 of primary school

Percentage of the children entering the first grade of primary school who eventually reach grade 5.

Crude death rate

Annual number of deaths per 1,000 population.

Crude birth rate

Annual number of births per 1,000 population.

Total fertility rate

The number of children that would be born per woman if she were to live to the end of her child-bearing years and bear children at each age in accordance with prevailing age-specific fertility rates.

Urban population

Percentage of population living in urban areas as defined according to the national definition used in the most recent population census.

Absolute poverty level

The income level below which a minimum nutritionally adequate diet plus essential non-food requirements is not affordable.

ODA

Official development assistance.

Debt service

The sum of interest payments and repayments of principal on external public and publicly guaranteed long-term debts.

Contraceptive prevalence

Percentage of married women aged 15-49 years currently using contraception.

Births attended

Percentage of births attended by physicians, nurses, midwives, trained primary health care workers or trained traditional birth attendants.

Maternal mortality rate

Annual number of deaths of women from pregnancy-related causes per 100,000 live births.

The State of the World's Children 1996 is about children in war—their lives and their deaths. In today's wars, millions of children are caught in the crossfire of armed conflicts. UNICEF, founded in 1946, in the aftermath of World War II, takes this opportunity to call special attention to their plight, as armed factions in more than 50 countries overrun cities, towns and villages and besiege hospitals and schools. Snipers shoot children at play. Women and girls are raped. Children, as soldiers, are exposed to daily terrors, in which barbaric acts scar entire lives.

In this report, UNICEF proposes an Anti-war Agenda—a call for global action to protect children from the worst of the ravages of war and to commit energy and resources to preventing future conflicts. International protections exist, including the Convention on the Rights of the Child. What is needed is collective will to prevent war, ensure that children under the age of 18 are not recruited as soldiers, ban the manufacture of land-mines and to take other crucial steps to end the suffering of children.

This 50th anniversary report also presents the progress made on behalf of children. Since 1946, UNICEF has worked to end the silent emergencies of poverty and disease. The toll has dropped—from 25 million young lives lost annually 50 years ago to 12.5 million. The challenge remains to ensure that all children are spared suffering and death that can be easily prevented.
